glAlphaFunc

NAME

glAlphaFunc -- specify the alpha test function

C SPECIFICATION

```
void glAlphaFunc(GLenum func
                 GLclampf ref)
```

PARAMETERS

func
: Specifies the alpha comparison function. Symbolic constants **GL_NEVER**, **GL_LESS**, **GL_EQUAL**, **GL_LEQUAL**, **GL_GREATER**, **GL_NOTEQUAL**, **GL_GEQUAL** and **GL_ALWAYS** are accepted. The default function is **GL_ALWAYS**.

ref
: Specifies the reference value that incoming alpha values are compared to. This value is clamped to the range 0 through 1, where 0 represents the lowest possible value and 1 the highest possible value. The default reference is 0.

DESCRIPTION

The alpha test discards fragments depending on the outcome of a comparison between the incoming fragment's alpha value and a constant reference value. **glAlphaFunc** specifies the reference and comparison function. The comparison is performed only if alpha testing is enabled. (See **glEnable** and **glDisable** of **GL_ALPHA_TEST**.)

func and *ref* specify the conditions under which the pixel is drawn. The incoming alpha value is compared to *ref* using the function specified by *func*. If the comparison passes, the incoming fragment is drawn, conditional on subsequent stencil and depth buffer tests. If the comparison fails, no change is made to the frame buffer at that pixel location. The comparison functions are as follows:

GL_NEVER
: Never passes.

GL_LESS
: Passes if the incoming alpha value is less than the reference value.

GL_EQUAL
: Passes if the incoming alpha value is equal to the reference value.

GL_LEQUAL
: Passes if the incoming alpha value is less than or equal to the reference value.

GL_GREATER
: Passes if the incoming alpha value is greater than the reference value.

GL_NOTEQUAL
: Passes if the incoming alpha value is not equal to the reference value.

GL_GEQUAL
Passes if the incoming alpha value is greater than or equal to the reference value.

GL_ALWAYS
Always passes.

glAlphaFunc operates on all pixel writes, including those resulting from the scan conversion of points, lines, polygons, and bitmaps, and from pixel draw and copy operations. **glAlphaFunc** does not affect screen clear operations.

NOTES

Alpha testing is done only in RGBA mode.

ERRORS

GL_INVALID_ENUM is generated if *func* is not an accepted value.

GL_INVALID_OPERATION is generated if **glAlphaFunc** is called between a call to **glBegin** and the corresponding call to **glEnd**.

ASSOCIATED GETS

glAccum

NAME

glAccum -- operate on the accumulation buffer

C SPECIFICATION

```
void glAccum(GLenum op,
             GLfloat value)
```

PARAMETERS

op
: Specifies the accumulation buffer operation. Symbolic constants **GL_LOAD**, **GL_ADD**, **GL_MULT**, and **GL_RETURN** are accepted.

value
: Specifies a floating-point value used in the accumulation buffer operation. *op* determines how *value* is used.

DESCRIPTION

The accumulation buffer is an extended-range color buffer. Images are not rendered into it. Rather, images rendered into oneof the color buffers are added to the contents of the accumulation buffer after rendering. Effects such as antialiasing (of points, lines, and polygons), motion blur, and depth of field can be created byaccumulating images generated with different transformation matrices.

Each pixel in the accumulation buffer consists of red, green, blue and alpha values. The number of bits per component in the accumulation buffer depends on the implementation. You can examine this number by calling **glGetIntergerv** four times, with arguments **GL_ACCUM_RED_BITS**, **GL_ACCUM_GREEN_BITS**, **GL_ACCUM_BLUE_BITS** and **GL_ACCUM_ALPHA_BITS**, respectively. Regardless of the number of bits per component, however, the range of values stored by each component is [-1, 1]. The accumulation buffer pixels are mapped one-to-one with frame buffer pixels.

glAccum operates on the accumulation buffer. The first argument, *op*, is a symbolic constant that selects an accumulation buffer operation. The second argument, *value*, is a floating-point value to be used in that operation. Five operations are specified: **GL_ACCUM**, **GL_LOAD**, **GL_ADD**, **GL_MULT** and **GL_RETURN**.

All accumulation buffer operations are limited to the area of the current scissor box and are applied identically to the red, green, blue and alpha components of each pixel. The contents of an accumulation buffer pixel component are undefined if the **glAccum** operation results in a value outside [-1, 1].

The operations are as follows:

GL_ACCUM
: Obtains R, G, B and A values from the buffer currently selected for reading (see **glClearAccum** directive, and issuing a **glClear** command with the accumulation buffer enabled.

NOTES

Only those pixels within the current scissor box are updated by any **glAccum** operation.

ERRORS

GL_INVALID_ENUM is generated if *op* is not an accepted value.

GL_INVALID_OPERATION is generated if there is no accumulation buffer.

GL_INVALID_OPERATION is generated if **glAccum** is called between a call to **glBegin** and the corresponding call to **glEnd**.

glBitmap

NAME

glBitmap -- draw a bitmap

C SPECIFICATION

```
void glBitmap(GLsizei width,
              GLsizei height,
              GLfloat xorig,
              GLfloat yorig,
              GLfloat xmove,
              GLfloat ymove,
              const GLubyte *bitmap)
```

PARAMETERS

width, height
: Specify the pixel width and height of the bitmap image.

xorig, yorig
: Specify the location of the origin of the bitmap image. The origin is measured from the lower left corner of the bitmap, with right and up being the positive axes.

xmove, ymove
: Specify the *x* and *y* offsets to be added to the current raster position after the bitmap is drawn.

bitmap
: Specifies the address of the bitmap image.

DESCRIPTION

A bitmap is a binary image. When drawn, the bitmap is positioned relative to the current raster position, and frame buffer pixels corresponding to ones in the bitmap are written using the current raster color or index. Frame buffer pixels corresponding to zeros in the bitmap are not modified.

glBitmap takes seven arguments. The first pair specify the width and height of the bitmap image. The second pair specify the location of the bitmap origin relative to the lower left corner of the bitmap image. The third pair of arguments specify *x* and *y* offsets to be added to the current raster position after the bitmap has been drawn. The final argument is a pointer to the bitmap itself.

The bitmap image is interpreted like image data for the **glDrawPixels** command, with *width* and *height* corresponding to the width and height arguments of that command, and with *type* set to **GL_BITMAP** and *format* set to **GL_COLOR_INDEX**.

Modes specified using **glPixelStore** affect the interpretation of bitmap image data, modes specified using **glPixelTransfer** do not.

If the current raster position is invalid, **glBitmap** is ignored. Otherwise, the lower left corner of the bitmap image is positioned at the window coordinates

$$x_w = \lfloor x_r - x_o \rfloor$$
$$y_w = \lfloor y_r - y_o \rfloor$$

where (*xr*,*yr*) is the raster position and (*xo*,*yo*) is the bitmap origin. Fragments are then generated for each pixel corresponding to a one in the bitmap image. These fragments are generated using the current raster *z* coordinate, color or color index, and current raster texture coordinates. They are then treated just as if they had been generated by a point, line, or polygon, including texture mapping, fogging and all per-fragment operations such as alpha and depth testing.

After the bitmap has been drawn, the *x* and *y* coordinates of the current raster position are offset by *xmove* and *ymove*. No change is made to the *z* coordinate of the current raster position, or to the current raster color, index, or texture coordinates.

ERRORS

GL_INVALID_VALUE is generated if *width* or *height* is negative.

GL_INVALID_OPERATION is generated if **glBitmap** is called between a call to **glBegin** and the corresponding call to **glEnd**.

glBegin, glEnd

NAME

glBegin, **glEnd** -- delimit the vertices of a primitive or a group of like primitives

C SPECIFICATION

`void glBegin(GLenum mode)`

PARAMETERS

mode
: Specifies the primitive or primitives that will be created from vertices presented between **glBegin** and the subsequent **glEnd**. Ten symbolic constants are accepted: **GL_POINTS**, **GL_LINES**, **GL_LINE_STRIP**, **GL_LINE_LOOP**, **GL_TRIANGLES**, **GL_TRIANGLE_STRIP**, **GL_TRIANGLE_FAN**, **GL_QUADS**, **GL_QUAD_STRIP**, and **GL_POLYGON**.

C SPECIFICATION

`void glEnd(void)`

DESCRIPTION

glBegin and **glEnd** delimit the verties that define a primitive or a group of like primitives. **glBegin** accepts a single argument that specifies which of ten ways the vertices are interpreted. Taking *n* as the integer count starting at one, and *N* as the total number of vertices specified, the interpretations are as follows:

GL_POINTS
: Treats each vertex as a single point. Vertex *n* defines point *n*. *N* points are drawn.

GL_LINES
: Treats each pair of vertices as an independent line segment. Vertices *2n-1* and *2n* define line *n*. *N/2* lines are drawn.

GL_LINE_STRIP
: Draws a connected group of line segments from the first vertex to the last. Vertices *n* and *n+1* define line *n*. *N-1* lines are drawn.

GL_LINE_LOOP
: Draws a connected group of line segments from the first vertex to the last, then back to the first. Vertices *n* and *n+1* define line *n*. The last line however, is defined by vertices *N* and *1*. *N* lines are drawn.

GL_TRIANGLES
: Treats each triplet of vertices as an independent triangle. Vertices *3n-2*, *3n-1*, and *3n* define triangle *n*. *N/3* triangles are drawn.

GL_TRIANGLE_STRIP
: Draws a connected group of triangles. One triangle is defined for each vertex presented after the first two vertices. For odd *n*, vertices *n*, *n+1*, and *n+2* define triangle *n*. For even *n*, vertices *n+1*, *n*, and *n+2* define triangle *n*. *N-2* triangles are drawn.

GL_TRIANGLE_FAN
Draws a connected group of triangles. One triangle is defined for each vertex presented after the first two vertices. Vertices *1*, *n+1*, and *n+2* define triangle *n*. *N-2* triangles are drawn.

GL_QUADS
Treats each group of four vertices as an independent quadriliteral. Vertices *4n-3*, *4n-2*, *4n-1*, and *4n* define quadriliteral *n*. *N/4* quadriliterals are drawn.

GL_QUAD_STRIP
Draws a connected group of quadriliterals. One quadriliteral is defined for each pair of vertices presented after the first pair. Vertices *2n-1*, *2n*, *2n+2*, and *2n+1* define quadriliteral *n*. *N/2-1* quadriliterals are drawn. Note that the order in which vertices are used to construct a quadriliteral from strip data is different from that used with independent data.

GL_POLYGON
Draws a single, convex polygon. Vertices *1* through *N* define this polygon.

Only a subset of GL commands can be used betwen **glBegin** and **glEnd**. The commands are **glVertex**, **glColor**, **glIndex**, **glNormal**, **glTexCoord**, **glEvalCoord**, **glEvalPoint**, **glMaterial**, and **glEdgeFlag**. Also, it is acceptable to use **glCallList** or **glCallLists** to execute display lists that include only the preceeding commands. If any other GL command is called between **glBegin** and **glEnd**, the error flag is set and the command is ignored.

Regardless of the value chosen for *mode*, there is no limit to the number of vertices that can be defined betwen **glBegin** and **glEnd**. Lines, triangles, quadriliterals, and polygons that are incompletely specified are not drawn. Incomplete specification results when either too few vertices are provided to specify even a single primitive or when an incorrect multiple of vertices is specified. The incomplete primitive is ignored; the rest are drawn.

The minimum specification of vertices for each primitive is as follows: 1 for a point, 2 for a line, 3 for a triangle, 4 for a quadriliteral, and 3 for a polygon. Modes that require a certain multiple of vertices are **GL_LINES** (2), **GL_TRIANGLES** (3), **GL_QUADS** (4), and **GL_QUAD_STRIP** (2).

ERRORS

GL_INVALID_ENUM is generated if *mode* is set to an unaccepted value.

GL_INVALID_OPERATION is generated if a command other than **glVertex**, **glColor**, **glIndex**, **glNormal**, **glTexCoord**, **glEvalCoord**, **glEvalPoint**, **glMaterial**, **glEdgeFlag**, **glCallList** or **glCallLists** is called between **glBegin** and the corresponding **glEnd**.

GL_INVALID_OPERATION is generated if **glEnd** is called before the corresponding **glBegin** is called.

SEE ALSO

glCallList

NAME

glCallList -- execute a display list

C SPECIFICATION

```
void glCallList(GLuint list)
```

PARAMETERS

list
: Specifies the integer name of the display list to be executed.

DESCRIPTION

glCallList causes the named display list to be executed. The commands saved in the display list are executed in order, just as if they were called without using a display list. If *list* has not been defined as a display list, **glCallList** is ignored.

glCallList can appear inside a display list. To avoid the possibility of infinite recursion resulting from display lists calling one another, a limit is placed on the nesting level of display lists during display-list execution. This limit is at least 64, and it depends on the implementation.

GL state is not saved and restored across a call to **glCallList**. Thus, changes made to GL state during the execution of a display list remain after execution of the display list is completed. Use **glPushAttrib**, **glPopAttrib**, **glPushMatrix**, and **glPopMatrix** to preserve GL state across **glCallList** calls.

NOTES

Display lists can be executed between a call to **glBegin** and the corresponding call to **glEnd**, as long as the display list includes only commands that are allowed in this interval.

ASSOCIATED GETS

glGet with argument **GL_MAX_LIST_NESTING**
glIsList

glBlendFunc

NAME

glBlendFunc -- specify pixel arithmetic

C SPECIFICATION

```
void glBlendFunc(GLenum sfactor,
                 GLenum dfactor)
```

PARAMETERS

sfactor
: Specifies how the red, green, blue and alpha source blending factors are computed. Nine symbolic constants are accepted: **GL_ZERO**, **GL_ONE**, **GL_DST_COLOR**, **GL_ONE_MINUS_DST_COLOR**, **GL_SRC_ALPHA**, **GL_ONE_MINUS_SRC_COLOR**, **GL_DST_ALPHA**, **GL_ONE_MINUS_DST_ALPHA**, and **GL_SRC_ALPHA_SATURATE**.

dfactor
: Specifies how the red, green, blue and alpha destination blending factors are computed. Eight symbolic constants are accepted: **GL_ZERO**, **GL_ONE**, **GL_SCR_COLOR**, **GL_ONE_MINUS_SRC_COLOR**, **GL_SRC_ALPHA**, **GL_ONE_MINUS_SRC_COLOR**, **GL_DST_ALPHA**, and **GL_ONE_MINUS_DST_ALPHA**.

DESCRIPTION

In RGB mode, pixels can be drawn using a function that blends the incoming (source) RGBA values with the RGBA values that are already in the frame buffer (the destination values). By default, blending is disabled. Use **glEnable** and **glDisable** with argument **GL_BLEND** to enable and disable blending.

glBlendFunc defines the operation whenbelnding is enabled. *sfactor* specifies which of nine methods is used to scale the source color components. *dfactor* specifies which of eight methods is used to scale the destination color components. The eleven possible methods are described in the table below. Each method defines four scale factors, one for red, green, blue and alpha.

In the table and in subsequent equations, source and destination color components are referred to as (*Rs*, *Gs*, *Bs*, *As*) and (*Rd*, *Gd*, *Bd*, *Ad*). They are understood to have integer values between zero and (*kR*, *kG*, *kB*, *kA*), where

$$k_c = 2^{m_c} - 1$$

and (*mR*, *mG*, *mB*, *mA*) is the number of red, green, blue and alpha bitplanes.

Source and destination scale factors are referred to as (*sR*, *sG*, *sB*, *sA*) and (*dR*, *dG*, *dB*, *dA*). The scale factors described in the table, denoted (*fR*, *fG*, *fB*, *fA*) represent either source or destination factors. All scale factors have range [0, 1].

parameter	(f_R, f_G, f_B, f_A)
GL_ZERO	$(0, 0, 0, 0)$
GL_ONE	$(1, 1, 1, 1)$
GL_SRC_COLOR	$(R_s/k_R, G_s/k_G, B_s/k_B, A_s/k_A)$
GL_ONE_MINUS_SRC_COLOR	$(1, 1, 1, 1) - (R_s/k_R, G_s/k_G, B_s/k_B, A_s/k_A)$
GL_DST_COLOR	$(R_d/k_R, G_d/k_G, B_d/k_B, A_d/k_A)$
GL_ONE_MINUS_DST_COLOR	$(1, 1, 1, 1) - (R_d/k_R, G_d/k_G, B_d/k_B, A_d/k_A)$
GL_SRC_ALPHA	$(A_s/k_A, A_s/k_A, A_s/k_A, A_s/k_A)$
GL_ONE_MINUS_SRC_ALPHA	$(1, 1, 1, 1) - (A_s/k_A, A_s/k_A, A_s/k_A, A_s/k_A)$
GL_DST_ALPHA	$(A_d/k_A, A_d/k_A, A_d/k_A, A_d/k_A)$
GL_ONE_MINUS_DST_ALPHA	$(1, 1, 1, 1) - (A_d/k_A, A_d/k_A, A_d/k_A, A_d/k_A)$
GL_SRC_ALPHA_SATURATE	$(i, i, i, 1)$

In the table,

$$i = \min(As, kA-Ad)/kA$$

To determine the blended RGBA values of a pixel when drawing in RGB mode, the system uses the following equations:

$$Rd = \min(kR, Rs*sR+Rd*dR)$$
$$Gd = \min(kG, Gs*sG+Gd*dG)$$
$$Bd = \min(kB, Bs*sB+Bd*dB)$$
$$Ad = \min(kA, As*sA+Ad*dA)$$

Despite the apparent precision of the above equations, blending arithmetic is not exactly specified, because blending operates with imprecise integer color values. However, a blend factor that should be equal to one is guaranteed not to modify its multiplicand, and a blend factor equal to zero reduces its multiplicand to zero. Thus, for example, when *sfactor* is **GL_SRC_ALPHA**, *dfactor* is **GL_ONE_MINUS_SRC_ALPHA**, and *As* is equal to *kA*, the equations reduce to simple replacement:

$$Rd = Rs$$
$$Gd = Gs$$
$$Bd = Bs$$
$$Ad = As$$

EXAMPLES

Transparency is best implemented using blend function (**GL_SRC_ALPHA**, **GL_ONE_MINUS_SRC_ALPHA**) with primitives sorted from farthest to nearest. Note that this transparency calculation does not require the presence of alpha bitplanes in the frame buffer.

Blend function (**GL_SRC_ALPHA**, **GL_ONE_MINUS_SRC_ALPHA**) is also useful for rendering antialiased points and lines in arbitrary order.

Polygon antialiasing is optimized using blend function (**GL_SRC_ALPHA_SATURATE**, **GL_ONE**) with polygons sorted from nearest to farthest. (See the **glEnable**, **glDisable** reference page and the **GL_POLYGON_SMOOTH** argument for information on polygon antialiasing.) Destination alpha bitplanes, which must be present for this blend function to operate correctly, store the accumulated coverage.

NOTES

Incoming (source) alpha is correctly thought of as material opacity, ranging from 1.0 (*kA*), representing complete opacity, to 0.0 (0), representing completely transparency.

When more than one color buffer is enabled for drawing, blending is done separately for each enabled buffer, using for destination color the contents of that buffer. (See **glDrawBuffer**.)

Blending affects only RGB rendering. It is ignored by color index renderers.

ERRORS

GL_INVALID_ENUM is generated if either *sfactor* or *dfactor* is not an accepted value.

GL_INVALID_OPERATION is generated if **glBlendFunc** is called between a call to **glBegin** and the corresponding call to **glEnd**.

ASSOCIATED GETS

glClear

NAME

glClear -- clear buffers within the viewport

C SPECIFICATION

```
void glClear(GLbitfield mask)
```

PARAMETERS

mask
: Bitwise OR of masks that indicate the buffers to be cleared. The four masks are **GL_COLOR_BUFFER_BIT**, **GL_DEPTH_BUFFER_BIT**, **GL_ACCUM_BUFFER_BIT**, and **GL_STENCIL_BUFFER_BIT**.

DESCRIPTION

glClear sets the bitplane area of the viewport to values previously selected by **glClearIndex**, **glClearStencil**, and **glDrawBuffer**.

The pixel ownership test, the scissor test, dithering and the buffer writemasks affect the operation of **glClear**. The scissor box bounds the cleared region. Alpha function, blend function, logical operation, stenciling, texture mapping, and z-buffering are ignored by **glClear**.

glClear takes a single argument that is the bitwise OR of several values indicating which buffer is to be cleared.

The values are as follows:

GL_COLOR_BUFFER_BIT
: Indicates the buffers currently enabled for color writing.

GL_DEPTH_BUFFER_BIT
: Indicates the depth buffer.

GL_ACCUM_BUFFER_BIT
: Indicates the accumulation buffer.

GL_STENCIL_BUFFER_BIT
: Indicates the stencil buffer.

The value to which each buffer is cleared depends on the setting of the clear value for that buffer.

NOTES

If a buffer is not present, then a **glClear** directed at that buffer has no effect.

ERRORS

GL_INVALID_VALUE is generated if any bit other than the four defined bits is set in *mask*.

GL_INVALID_OPERATION is generated if **glClear** is called between a call to **glBegin** and the corresponding call to **glEnd**.

glCallLists

NAME

glCallLists -- execute a list of display lists

C SPECIFICATION

```
void glCallLists(GLsizei n,
                 GLenum type,
                 const GLvoid *lists)
```

PARAMETERS

n
: Specifies the number of display lists to be executed.

type
: Specifies the type of values in *lists*. Symbolic constants **GL_BYTE**, **GL_UNSIGNED_BYTE**, **GL_SHORT**, **GL_UNSIGNED_SHORT**, **GL_INT**, **GL_UNSIGNED_INT**, **GL_FLOAT**, **GL_2_BYTES**, **GL_3_BYTES**, and **GL_4_BYTES** are accepted.

lists
: Specifies the address of an array of name offsets in the display list. The pointer type is void because the offsets can be bytes, shorts, ints, or floats, depending on the value of *type*.

DESCRIPTION

glCallLists causes each display list in the list of names passed as *lists* to be executed. As a result, the commands saved in each display list are executed in order,just as if they were called without using a display list. Names of display lists that have not been defined are ignored.

glCallLists provides an efficient means for executing display lists. *n* allows lists with various name formats to be accepted. The formats are as follows:

GL_BYTE
: *lists* is treated as an array of signed bytes, each in the range -128 through 127.

GL_UNSIGNED_BYTE
: *lists* is treated as an array of unsigned bytes, each in the range 0 through 255.

GL_SHORT
: *lists* is treated as an array of signed two-byte integers, each in the range -32768 through 32767.

GL_UNSIGNED_SHORT
: *lists* is treated as an array of unsigned two-byte integers, each in the range 0 through 65535.

GL_INT
: *lists* is treated as an array of signed four-byte integers.

GL_UNSIGNED_INT
: *lists* is treated as an array of unsigned four-byte integers.

GL_FLOAT
: *lists* is treated as an array of four-byte floating-point values.

GL_2_BYTES
: *lists* is treated as an array of unsigned bytes. Each pair of bytes specifies a single display-list name. The value of the pair is computed as 256 times the unsigned value of the first byte plus the unsigned value of the second byte.

GL_3_BYTES
: *lists* is treated as an array of unsigned bytes. Each triplet of bytes specifies a single display-list name. The value of the triplet is computed as 65536 times the unsigned value of the first byte, plus 256 times the unsigned value of the second byte, plus the unsigned value of the third byte.

GL_4_BYTES
: *lists* is treated as an array of unsigned bytes. Each quadruplet of bytes specifies a single display-list name. The value of the quadruplet is computed as 16777216 times the unsigned value of the first byte, plus 65536 times the unsigned value of the second byte, plus 256 times the unsigned value of the third byte, plus the unsigned value of the fourth byte.

The list of display list names is not null-terminated. Rather, *n* specifies how many names are to be taken from *lists*.

An additional level of indirection is made available with the **glListBase** command, which specifies a signed offset that is added to each display-list name specified in *lists* before that display list is executed.

glCallLists can appear inside a display list. To avoid the possibility of infinite recursion resulting from display lists calling one another, a limit is placed on the nesting level of display lists during display-list execution. This limit must be at least 64, and it depends on the implementation.

GL state is not saved and restored across a call to **glCallLists**. Thus, changes made to GL state during the execution of the display lists remain after execution is completed. Use **glPushAttrib**, **glPopAttrib**, **glPushMatrix**, and **glPopMatrix** to preserve GL state across **glCallLists** calls.

NOTES

Display lists can be executed between a call to **glBegin** and the corresponding call to **glEnd**, as long as the display list includes only commands that are allowed in this interval.

glClearColor

NAME

glClearColor -- specify clear values for the color buffers

C SPECIFICATION

```
void glClearColor(GLclampf red,
                  GLclampf green,
                  GLclampf blue,
                  GLclampf alpha)
```

PARAMETERS

red, *green*, *blue*, *alpha*
Specify the red, green, blue, and alpha values used when the color buffers are cleared. The default values are all zero.

DESCRIPTION

glClearColor specifies the red, green, blue, and alpha values used by **glClear** to clear the color buffers. Values specified by **glClearColor** are clamped to the range [0, 1].

ERRORS

GL_INVALID_OPERATION is generated if **glClearColor** is called between a call to **glBegin** and the corresponding call to **glEnd**.

ASSOCIATED GETS

glGet with argument **GL_COLOR_CLEAR_VALUE**

SEE ALSO

glClear

---

glClearAccum

NAME

glClearAccum -- specify clear values for the accumulation buffer

C SPECIFICATION

```
void glClearAccum(GLfloat red,
                  GLfloat green,
                  GLfloat blue,
                  GLfloat alpha)
```

PARAMETERS

red, *green*, *blue*, *alpha*
: Specify the red, green, blue, and alpha values used when the accumulation buffer is cleared. The default values are all zero.

DESCRIPTION

glClearAccum specifies the red, green, blue, and alpha values used by **glClear** to clear the accumulation buffer. Values specified by **glClearAccum** are clamped to the range [-1, 1].

ERRORS

GL_INVALID_OPERATION is generated if **glClearAccum** is called between a call to **glBegin** and the corresponding call to **glEnd**.

glClearIndex

NAME

glClearIndex -- specify the clear value for the color index buffers

C SPECIFICATION

```
void glClearIndex(GLfloat c)
```

PARAMETERS

c

Specifies the index used when the color index buffers are cleared. The default value is zero

DESCRIPTION

glClearIndex specifies the index used by **glClear** to clear the color index buffers. *c* is not clamped. Rather, *c* is converted to a fixed-point value with unspecified precision to the right of the binary point. The integer part of this value is then masked with 2^*m*-1, where *m* is the number of bits in a color index stored in the frame buffer.

ERRORS

GL_INVALID_OPERATION is generated if **glClearIndex** is called between a call to **glBegin** and the corresponding call to **glEnd**.

ASSOCIATED GETS

glGet with argument **GL_INDEX_CLEAR_VALUE**
glGet with argument **GL_INDEX_BITS**

glClearDepth

NAME

glClearDepth -- specify the clear value for the depth buffer

C SPECIFICATION

```
void glClearDepth(GLclampd depth)
```

PARAMETERS

depth
Specifies the depth value used when the depth buffer is cleared.

DESCRIPTION

glClearDepth specifies the depth value used by **glClear** to clear the depth buffer. Values specified by **glClearDepth** are clamped to the range [0, 1].

ERRORS

GL_INVALID_OPERATION is generated if **glClearDepth** is called between a call to **glBegin** and the corresponding call to **glEnd**.

ASSOCIATED GETS

glGet with argument **GL_DEPTH_CLEAR_VALUE**

SEE ALSO

glClear

glClipPlane

NAME

glClipPlane -- specify a plane against which all geometry is clipped

C SPECIFICATION

```
void glClipPlane(GLenum plane,
                 const GLdouble *equation)
```

PARAMETERS

plane
: Specifies which clipping plane is being positioned. Symbolic names of the form **GL_CLIP_PLANE***i*, where *i* is an integer between 0 and **GL_MAX_CLIP_PLANES**-1 are accepted.

equation
: Specifies the address of an array of four double-precision floating-point values. These values are interpreted as a plane equation.

DESCRIPTION

Geometry is always clipped against the boundaries of a six-plane frustum in *x*, *y*, and *z*. **glClipPlane** allows the specification of additional planes, not necessarily perpendicular to the *x*, *y*, or *z* axis, against which all geometry is clipped. Up to **GL_MAX_CLIP_PLANES** planes can be specified, where **GL_MAX_CLIP_PLANES** is at least six in all implementations. Because the resulting clipping region is the intersection of the defined half-spaces, it is always convex.

glClipPlane specifies a half-space using a four-component plane equation. When **glClipPlane** is called, *equation* is transformed by the inverse of the modelview matrix and stored in the resulting eye coordinates. Subsequent changes to the modelview matrix have no effect on the stored plane-equation components. If the dot product of the eye coordinates of a vertex with the stored plane equation components is positive or zero, the vertex is *in* with respect to that clipping plane. Otherwise, it is *out*.

Clipping planes are enabled and disabled with **glDisable**, and called with the argument **GL_CLIP_PLANE***i*, where *i* is the plane number.

By default, all clipping planes are defined as (0,0,0,0) in eye coordinates and are disabled.

NOTES

It is always the case, that **GL_CLIP_PLANE***i* = **GL_CLIP_PLANE0**+*i*.

ERRORS

GL_INVALID_ENUM is generated if *plane* is not an accepted value.

GL_INVALID_OPERATION is generated if **glClipPlane** is called between a call to **glBegin** and the corresponding call to **glEnd**.

ASSOCIATED GETS

glClearStencil

NAME

glClearStencil -- specify the clear value for the stencil buffer

C SPECIFICATION

```
void glClearStencil(GLint s)
```

PARAMETERS

s

Specifies the index used when the stencil buffer is cleared. The default value is zero

DESCRIPTION

glClearStencil specifies the index used by **glClear** to clear the stencil buffer. *s* is masked with 2^*m*-1, where *m* is the number of bits in the stencil buffer.

ERRORS

GL_INVALID_OPERATION is generated if **glClearStencil** is called between a call to **glBegin** and the corresponding call to **glEnd**.

glColorMask

NAME

glColorMask -- enable and disable writing of frame buffer color components

C SPECIFICATION

```
void glColorMask(GLboolean red,
                 GLboolean green,
                 GLboolean blue,
                 GLboolean alpha)
```

PARAMETERS

red, *green*, *blue*, *alpha*
: Specify, whether red, green, blue, and alpha can or cannot be written into the frame buffer. The default values are all **GL_TRUE**, indicating, that the color components can be written.

DESCRIPTION

glColorMask specifies, whether the individual color components in the frame buffer can or cannot be written. If *red* is **GL_FALSE**, for example, no change is made to the red component of any pixel in any of the color buffers, regardless of the drawing operation attempted.

Changes to individual bits of components cannot be controlled. Rather, changes are either enabled or disabled for entire color components.

ERRORS

GL_INVALID_OPERATION is generated if **glColorMask** is called between a call to **glBegin** and the corresponding call to **glEnd**.

                GLuint alpha)
void glColor4us(GLushort red,
                GLushort green,
                GLushort blue,
                GLushort alpha)
```

PARAMETERS

red, *green*, *blue*

Specify new red, green, and blue values for the current color.

alpha

Specifies a new alpha value for the current color. Included only in the four-argument **glColor4** command.

C SPECIFICATION

```
void glColor3bv(const GLbyte *v)
void glColor3dv(const GLdouble *v)
void glColor3fv(const GLfloat *v)
void glColor3iv(const GLint *v)
void glColor3sv(const GLshort *v)
void glColor3ubv(const GLubyte *v)
void glColor3uiv(const GLuint *v)
void glColor3usv(const GLushort *v)
void glColor4bv(const GLbyte *v)
void glColor4dv(const GLdouble *v)
void glColor4fv(const GLfloat *v)
void glColor4iv(const GLint *v)
void glColor4sv(const GLshort *v)
void glColor4ubv(const GLubyte *v)
void glColor4uiv(const GLuint *v)
void glColor4usv(const GLushort *v)
```

PARAMETERS

v

Specifies a pointer to an array that contains red, green, blue, and (sometimes) alpha values.

DESCRIPTION

The GL stores both a current single-valued color index and a current four-valued RGBA color. **glColor** sets a new four-valued RGBA color. **glColor** has two major variants: **glColor3** and **glColor4**. **glColor3** variants specify new red, green, and blue values explicitly, and set the current alpha value to 1.0 implicitly. **glColor4** variants specify all four color components explicitly.

glColor3b, **glColor4b**, **glColor3s**, **glColor4s**, **glColor3i**, and **glColor4i** take three or four unsigned byte, short or long integers as arguments. When **v** is appended to the name, the color commands can take a pointer to an array of such values.

Current color values are stored in floating-point format, with unspecified mantissa and exponent sizes. Unsigned integer color components, when specified, are linearly mapped to floating-point values such that the largest representable value maps to 1.0 (full intensity), and zero maps to 0.0 (zero intensity). Signed integer color components, when specified, are linearly mapped to floating-point values such that the most positive representable value maps to 1.0, and the most negative representable value maps to -1.0. Floating-point values are mapped directly.

Neither floating-point nor signed integer values are clamped to the range [0, 1] before updating the current color. However, color components are clamped to this range before they are interpolated or written into a color buffer.

NOTES

The current color can be updated at any time. In particular, **glColor** can be called between a call to **glBegin** and the corresponding call to **glEnd**.

glCopyPixels

NAME

glCopyPixels -- copy pixels in the frame buffer

C SPECIFICATION

```
void glCopyPixels(GLint x,
                  GLint y,
                  GLsizei width,
                  GLsizei height,
                  GLenum type)
```

PARAMETERS

x, *y*
: Specify the window coordinates of the lower left corner of the rectangular region of pixels to be copied.

width, *height*
: Specify the dimensions of the rectangular region of pixels to be copied. Both must be nonnegative.

type
: Specifies whether color values, depth values, or stencil values are to be copied. Symbolic constants **GL_COLOR**, **GL_DEPTH**, and **GL_STENCIL** are accepted.

DESCRIPTION

glCopyPixels copies a screen-aligned rectangle of pixels from the specified frame buffer location to a region relative to the current raster position. Its operation is well defined only if the entire pixel source region is within the exposed portion of the window. Results from copies from outside the window, or from regions of the window that are not exposed, are hardware dependant and undefined.

x and *y* specify the window coordinates of the lower left corner of the rectangular region to be copied. *width* and *height* specify the dimensions of the rectangular region to be copied. Both *width* and *height* must not be negative.

Several parameters control the processing of the pixel data while it is being copied. These parameters are set with three commands: **glPixelTransfer**, **glPixelMap**, and **glPixelZoom**. This reference page describes the effect on **glCopyPixels** of most, but not all, of the parameters specified by these three commands.

glCopyPixels copies values from each pixel with the lower left-hand corner at (*x*+*i*,*y*+*j*) for 0 <= *i* < *width* and 0 <= *j* < *height*. This pixel is said to be the *i*th pixel in the *j*th row. Pixels are copied in row order from the lowest to the highest row, left to right in each row.

type specifies whether color, depth, or stencil data is to be copied. The details of the transfer for each data type are as follows:

GL_COLOR
: Indices or RGBA colors are read from the buffer currently specified as the read source buffer (see **glReadBuffer**). If the GL is in color index mode, each index that is read from this buffer is converted to a fixed-point format with an unspecified number of bits to the right of the binary point. Each index is then shifted left by **GL_INDEX_SHIFT** bits, and added to **GL_INDEX_OFFSET**. If **GL_INDEX_SHIFT** is negative, the shift is to the right. In either case, zero bits fill otherwise unspecified bit locations in the result. If **GL_MAP_COLOR**

is true, the index is replaced with the value that it references in lookup table **GL_PIXEL_MAP_I_TO_I**. Whether the lookup replacement of the index is done or not, the integer part of the index is then ANDed with 2^*b*-1, where *b* is the number of bits in a color index buffer.

If the GL is in RGBA mode, the red, green, blue and alpha components of each pixel that is read are converted to an internal floating-point format with unspecified precision. The conversion maps the largest representable component value to 1.0 and component value zero to 0.0. The resulting floating-point color values are then multiplied by **GL_*c*_SCALE** and added to **GL_*c*_BIAS**, where *c* is **RED**, **GREEN**, **BLUE**, and **ALPHA** for the respective color components. The results are clamped to the range [0, 1]. If **GL_MAP_COLOR** is true, each color component is scaled by the size of lookup table **GL_PIXEL_MAP_*c*_TO_*c***, then replaced by the value that it references in that table. *c* is **R**, **G**, **B**, or **A**, respectively.

The resulting indices or RGBA colors are then converted to fragments by attaching the current raster position *z* coordinate and texture coordinates to each pixel, then assigning window coordinates (*xr*+*i*, *yr*+*j*), where (*xr*, *yr*) is the current raster position, and the pixel was the *i*th pixel in the *j*th row. These pixel fragments are then treated just like the fragments generated by rasterizing points, lines, or polygons. Texture mapping, fog, and all the fragment operations are applied before the fragments are written to the frame buffer.

GL_DEPTH

Depth values are read from the depth buffer and converted directly to an internal floating-point format with unspecified precision. The resulting floating-point depth value is then multiplied by **GL_DEPTH_SCALE** and added to **GL_DEPTH_BIAS**. The result is clamped to the range [0, 1].

The resulting depth components are then converted to fragments by attaching the current raster position color or color index and texture coordinates to each pixel, then assigning window coordinates (*xr*+*i*, *yr*+*j*), where (*xr*, *yr*) is the current raster position, and the pixel was the *i*th pixel in the *j*th row. These pixel fragments are then treated just like the fragments generated by rasterizing points, lines, or polygons. Texture mapping, fog, and all the fragment operations are applied before the fragments are written to the frame buffer.

GL_STENCIL

Stencil indices are read from the stencil buffer and converted to an internal fixed-point format with an unspecified number of bits to the right of the binary point. Each fixed-point index is then shifted left by **GL_INDEX_SHIFT** bits, and added to **GL_INDEX_OFFSET**. If **GL_INDEX_SHIFT** is negative, the shift is to the right. In either case, zero bits fill otherwise unspecified bit locations in the result. If **GL_MAP_STENCIL** is true, the index is replaced with the value that it references in lookup table **GL_PIXEL_MAP_S_TO_S**. Whether the lookup replacement of the index is done or not, the integer part of the index is then ANDed with 2^*b*-1, where *b* is the number of bits in the stencil buffer. The resulting stencil indices are then written to the stencil buffer such that the index read from the *i*th location of the *j*th row is written to location (*xr*+*i*, *yr*+*j*), where (*xr*, *yr*) is the current raster position. Only the pixel ownership test, the scissor test, and the stencil writemask affect these writes.

The rasterization described thus far assumes pixel zoom factors of 1.0. If **glPixelStore** have no effect on the operation of **glCopyPixels**.

ERRORS

GL_INVALID_ENUM is generated if *type* is not an accepted value.

GL_INVALID_VALUE is generated if either *width* or *height* is negative.

GL_INVALID_OPERATION is generated if *type* is **GL_DEPTH** and there is no depth buffer.

GL_INVALID_OPERATION is generated if *type* is **GL_STENCIL** and there is no stencil buffer.

GL_INVALID_OPERATION is generated if **glCopyPixels** is called between a call to **glBegin** and the corresponding call to **glEnd**.

glColorMaterial

NAME

glColorMaterial -- cause a material color to track the current color

C SPECIFICATION

```
void glColorMaterial(GLenum face,
                     GLenum mode)
```

PARAMETERS

face
: Specifies, whether front, back, or both front and back material parameters should track the current color. Accepted values are **GL_FRONT**, **GL_BACK**, and **GL_FRONT_AND_BACK**. The default value is **GL_FRONT_AND_BACK**.

mode
: Specifies which of several material parameters track the current color. Accepted values are **GL_EMISSION**, **GL_AMBIENT**, **GL_DIFFUSE**, **GL_SPECULAR**, and **GL_AMBIENT_AND_DIFFUSE**. The default value is **GL_AMBIENT_AND_DIFFUSE**.

DESCRIPTION

glColorMaterial specifies which material parameters track the current color. When **GL_COLOR_MATERIAL** is enabled, the material parameter or parameters specified by *mode*, of the material or materials specified by *face*, track the current color at all times.

GL_COLOR_MATERIAL is enabled and disabled using the commands **glEnable** and **glDisable**, called with **GL_COLOR_MATERIAL** as their argument. By default, it is disabled.

NOTES

glColorMaterial allows a subset of material parameters to be changed for each vertex using only the **glColor** command, without calling **glMaterial**. If only such a subset of parameters is to be specified for each vertex, **glColorMaterial** is preferred over calling **glMaterial**.

ERRORS

GL_INVALID_ENUM is generated if *face* or *mode* is not an accepted value.

GL_INVALID_OPERATION is generated if **glColorMaterial** is called between a call to **glBegin** and the corresponding call to **glEnd**.

glDeleteLists

NAME

glDeleteLists -- delete a contiguous group of display lists

C SPECIFICATION

```
void glDeleteLists(GLuint list,
                   GLsizei range)
```

PARAMETERS

list

Specifies the integer name of the first display list to delete.

range

Specifies the number of display lists to delete.

DESCRIPTION

glDeleteLists causes a contiguous group of display lists to be deleted. *list* is the name of the first display list to be deleted, and *range* is the number of display lists to delete. All display lists *d* with *list* <= *d* <= *list*+*range*-1 are deleted.

All storage locations allocated to the specified display lists are freed, and the names are available for reuse at later time. Names within that range that do not have an associated display list are ignored. If *range* is zero, nothing happens.

ERRORS

GL_INVALID_VALUE is generated if *range* is negative.

GL_INVALID_OPERATION is generated if **glDeleteLists** is called between a call to **glBegin** and the corresponding call to **glEnd**.

SEE ALSO

glCallList, **glCallLists**, **glGenList**, **glIsList**, **glNewList**

glCullFace

NAME

glCullFace -- specify whether front- or back-facing facets can be culled

C SPECIFICATION

```
void glCullFace(GLenum mode)
```

PARAMETERS

mode
: Specifies whether front- or back-facing facets are candidates for culling. Symbolic constants **GL_FRONT** and **GL_BACK** are accepted. The default value is **GL_BACK**.

DESCRIPTION

glCullFace specifies whether front- or back-facing facets are culled (as specified by *mode*) when facet culling is enabled. Facet culling is enabled and disabled using the **glEnable** and **glDisable** commands with the argument **GL_CULL_FACE**. Facets include triangles, quadriliterals, polygons, and rectangles.

glFrontFace specifies which of the clockwise and counterclockwise facets are front-facing and back-facing. See **glFrontFace**.

ERRORS

GL_INVALID_ENUM is generated if *mode* is not an accepted value.

GL_INVALID_OPERATION is generated if **glCullFace** is called between a call to **glBegin** and the corresponding call to **glEnd**.

glDepthMask

NAME

glDepthMask -- enable or disable writing into the depth buffer

C SPECIFICATION

```
void glDepthMask(GLboolean flag)
```

PARAMETERS

flag
: Specifies whether the depth buffer is enabled for writing. If *flag* is zero, depth buffer writing is disabled. Otherwise, it is enabled. Initially, depth buffer writing is enabled.

DESCRIPTION

glDepthMask specifies whether the depth buffer is enabled for writing. If *flag* is zero, depth buffer writing is disabled. Otherwise, it is enabled. Initially, depth buffer writing is enabled.

ERRORS

GL_INVALID_OPERATION is generated if **glDepthMask** is called between a call to **glBegin** and the corresponding call to **glEnd**.

glDepthFunc

NAME

glDepthFunc -- specify the value used for depth buffer comparisons

C SPECIFICATION

```
void glDepthFunc(GLenum func)
```

PARAMETERS

func
: Specifies the depth comparison function. Symbolic constants **GL_NEVER**, **GL_LESS**, **GL_EQUAL**, **GL_LEQUAL**, **GL_GREATER**, **GL_NOTEQUAL**, **GL_GEQUAL**, and **GL_ALWAYS** are accepted. The default value is **GL_LESS**.

DESCRIPTION

glDepthFunc specifies the function used to compare each incoming pixel *z* value with the *z* value present in the depth buffer. The comparison is performed only if depth testing is enabled. (See **glEnable** and **glDisable** of **GL_DEPTH_TEST**.)

func specifies the conditions under which the pixel will be drawn. The comparison functions are as follows:

GL_NEVER
: Never passes.

GL_LESS
: Passes if the incoming *z* value is less than the stored *z* value.

GL_EQUAL
: Passes if the incoming *z* value is equal to the stored *z* value.

GL_LEQUAL
: Passes if the incoming *z* value is less than or equal to the stored *z* value.

GL_GREATER
: Passes if the incoming *z* value is greater than the stored *z* value.

GL_NOTEQUAL
: Passes if the incoming *z* value is not equal to the stored *z* value.

GL_GEQUAL
: Passes if the incoming *z* value is greater than or equal to the stored *z* value.

GL_ALWAYS
: Always passes.

The default value of *func* is **GL_LESS**. Initially, depth testing is disabled.

ERRORS

GL_INVALID_ENUM is generated if *func* is not an accepted value.

GL_INVALID_OPERATION is generated if **glDepthFunc** is called between a call to **glBegin** and the corresponding call to **glEnd**.

```

PARAMETERS

cap
: Specifies a symbolic constant indicating a GL capability.

DESCRIPTION

glEnable and **glDisable** enable and disable various capabilities. Use **glIsEnabled** or **glGet** to determine the current setting of any capability.

Both **glEnable** and **glDisable** take a single argument, *cap*, which can assume one of the following values:

GL_ALPHA_TEST
: If enabled, do alpha testing. See **glAlphaFunc**.

AUTO_NORMAL
: If enabled, compute surface normal vectors analytically when either **GL_MAP2_VERTEX_3** or **GL_MAP2_VERTEX_4** is used to generate vertices. See **glMap2**.

GL_BLEND
: If enabled, blend the incoming RGBA color values with the values in the color buffers. See **glBlendFunc**.

GL_CLIP_PLANE*i*
: If enabled, clip geometry against user-defined clipping plane *i*. See **glClipPlane**.

GL_COLOR_MATERIAL
: If enabled, have one or more material parameters track the current color. See **glColorMaterial**.

GL_CULL_FACE
: If enabled, cull polygons based on their winding in window coordinates. See **glCullFace**.

GL_DEPTH_TEST
: If enabled, do depth comparisons and update the depth buffer. See **glDepthFunc** and **glDepthRange**.

GL_DITHER
If enabled, dither color components or indices before they are written to the color buffer.

GL_FOG
If enabled, blend a fog color into the posttexturing color. See **glFog**.

GL_LIGHT*i*
If enabled, include light *i* in the evaluation of the lighting equation. See **glLightModel** and **glLight**.

GL_LIGHTING
If enabled, use the current lighting parameters to compute the vertex color or index. Otherwise, simply associate the current color or index with each vertex. See **glMaterial**, **glLightModel** and **glLight**.

GL_LINE_SMOOTH
If enabled, draw lines with correct filtering. Otherwise, draw aliased lines. See **glLineWidth**.

GL_LINE_STIPPLE
If enabled, use the current line stipple pattern when drawing lines. See **glLineStipple**.

GL_LOGIC_OP
If enabled, apply the currently selected logical operation to the incoming and and color buffer indices. See **glLogicOp**.

GL_MAP1_COLOR_4
If enabled, calls to **glEvalCoord1**, **glEvalMesh1** and **glEvalPoint1** will generate RGBA values. See **glMap1**.

GL_MAP1_INDEX
If enabled, calls to **glEvalCoord1**, **glEvalMesh1** and **glEvalPoint1** will generate color indices. See **glMap1**.

GL_MAP1_NORMAL
If enabled, calls to **glEvalCoord1**, **glEvalMesh1** and **glEvalPoint1** will generate normals. See **glMap1**.

GL_MAP1_TEXTURE_COORD_1
If enabled, calls to **glEvalCoord1**, **glEvalMesh1** and **glEvalPoint1** will generate *s* texture coordinates. See **glMap1**.

GL_MAP1_TEXTURE_COORD_2
If enabled, calls to **glEvalCoord1**, **glEvalMesh1** and **glEvalPoint1** will generate *s* and *t* texture coordinates. See **glMap1**.

GL_MAP1_TEXTURE_COORD_3
If enabled, calls to **glEvalCoord1**, **glEvalMesh1** and **glEvalPoint1** will generate *s*, *t* and *r* texture coordinates. See **glMap1**.

GL_MAP1_TEXTURE_COORD_4
If enabled, calls to **glEvalCoord1**, **glEvalMesh1** and **glEvalPoint1** will generate *s*, *t*, *r* and *q* texture coordinates. See **glMap1**.

GL_MAP1_VERTEX_3
If enabled, calls to **glEvalCoord1**, **glEvalMesh1** and **glEvalPoint1** will generate *x*, *y* and *z* vertex coordinates. See **glMap1**.

GL_MAP1_VERTEX_4
If enabled, calls to **glEvalCoord1**, **glEvalMesh1** and **glEvalPoint1** will generate homogeneous *x*, *y*, *z* and *w* vertex coordinates. See **glMap1**.

GL_MAP2_COLOR_4
If enabled, calls to **glEvalCoord2**, **glEvalMesh2** and **glEvalPoint2** will generate RGBA values. See **glMap2**.

GL_MAP2_INDEX
If enabled, calls to **glEvalCoord2**, **glEvalMesh2** and **glEvalPoint2** will generate color indices. See **glMap2**.

GL_MAP2_NORMAL
If enabled, calls to **glEvalCoord2**, **glEvalMesh2** and **glEvalPoint2** will generate normals. See **glMap2**.

GL_MAP2_TEXTURE_COORD_1
If enabled, calls to **glEvalCoord2**, **glEvalMesh2** and **glEvalPoint2** will generate *s* texture coordinates. See **glMap2**.

GL_MAP2_TEXTURE_COORD_2
If enabled, calls to **glEvalCoord2**, **glEvalMesh2** and **glEvalPoint2** will generate *s* and *t* texture coordinates. See **glMap2**.

GL_MAP2_TEXTURE_COORD_3
If enabled, calls to **glEvalCoord2**, **glEvalMesh2** and **glEvalPoint2** will generate *s*, *t* and *r* texture coordinates. See **glMap2**.

GL_MAP2_TEXTURE_COORD_4
If enabled, calls to **glEvalCoord2**, **glEvalMesh2** and **glEvalPoint2** will generate *s*, *t*, *r* and *q* texture coordinates. See **glMap2**.

GL_MAP2_VERTEX_3
If enabled, calls to **glEvalCoord2**, **glEvalMesh2** and **glEvalPoint2** will generate *x*, *y* and *z* vertex coordinates. See **glMap2**.

GL_MAP2_VERTEX_4
If enabled, calls to **glEvalCoord2**, **glEvalMesh2** and **glEvalPoint2** will generate homogeneous *x*, *y*, *z* and *w* vertex coordinates. See **glMap2**.

GL_NORMALIZE
If enabled, normal vectors specified with **glNormal** are scaled to unit length after transformation. See **glNormal**.

GL_POINT_SMOOTH
If enabled, draw points with proper filtering. Otherwise, draw aliased points. See **glPointSize**.

GL_POLYGON_SMOOTH
If enabled, draw polygons with proper filtering. Otherwise, draw aliased polygons. See **glPolygonMode**.

GL_POLYGON_STIPPLE
If enabled, use the current polygon stipple patttern when rendering polygons. See **glPolygonStipple**.

GL_SCISSOR_TEST
If enabled, discard fragments that are outside the scissor rectangle. See **glScissor**.

GL_STENCIL_TEST
If enabled, do stencil testing and update the stencil buffer. See **glStencilFunc** and **glStencilOp**.

GL_TEXTURE_1D
If enabled, one-dimensional texturing is performed (unless two-dimensional texturing is also enabled). See **glTexImage1D**.

GL_TEXTURE_2D
If enabled, two-dimensional texturing is performed. See **glTexImage2D**.

GL_TEXTURE_GEN_Q
If enabled, the *q* texture coordinate is computed using the texture generation function defined with **glTexGen**. Otherwise, the current *q* texture coordinate is used. See **glTexGen**.

GL_TEXTURE_GEN_R
If enabled, the *r* texture coordinate is computed using the texture generation function defined with **glTexGen**. Otherwise, the current *r* texture coordinate is used. See **glTexGen**.

GL_TEXTURE_GEN_S
If enabled, the *s* texture coordinate is computed using the texture generation function defined with **glTexGen**. Otherwise, the current *s* texture coordinate is used. See **glTexGen**.

GL_TEXTURE_GEN_T
If enabled, the *t* texture coordinate is computed using the texture generation function defined with **glTexGen**. Otherwise, the current *t* texture coordinate is used. See **glTexGen**.

ERRORS

GL_INVALID_ENUM is generated if *cap* is not one of the values listed above.

GL_INVALID_OPERATION is generated if **glEnable** is called between a call to **glBegin** and the corresponding call to **glEnd**.

glDepthRange

NAME

glDepthRange -- specify the mapping of *z* values from normalized device coordinates to window coordinates

C SPECIFICATION

```
void glDepthRange(GLclampd near,
                  GLclampd far)
```

PARAMETERS

near
: Specifies the mapping of the near clipping plane to window coordinates. The default value is 0.

far
: Specifies the mapping of the far clipping plane to window coordinates. The default value is 1.

DESCRIPTION

After clipping and division by *w*, *z* coordinates range from -1.0 to 1.0, corresponding to the near and far clipping planes. **glDepthRange** specifies a linear mapping of the normalized *z* coordinates in this range to window *z* coordinates. Regardless of the actual depth buffer implementation, window coordinate depth values are treated as though they range from 0.0 through 1.0 (like color components). Thus, the values accepted by **glDepthRange** are both clamped to this range before they are accepted.

The default mapping of 0, 1 maps the near plane to 0 and the far plane to 1. With this mapping, the depth buffer range is fully utilized.

NOTES

It is not necessary, that *near* be less than *far*. Reverse mappings such as 1, 0 are acceptable.

ERRORS

GL_INVALID_OPERATION is generated if **glDepthRange** is called between a call to **glBegin** and the corresponding call to **glEnd**.

ASSOCIATED GETS

glGet with argument **GL_DEPTH_RANGE**

glDrawPixels

NAME

glDrawPixels -- write a block of pixels to the frame buffer

C SPECIFICATION

```
void glDrawPixels(GLsizei width,
                  GLsizei height,
                  GLenum format,
                  GLenum type,
                  const GLvoid *pixels)
```

PARAMETERS

width, *height*
: Specify the dimensions of the pixel rectangle that will be written into the frame buffer.

format
: Specifies the format of the pixel data. Symbolic constants **GL_COLOR_INDEX**, **GL_STENCIL_INDEX**, **GL_DEPTH_COMPONENT**, **GL_RGBA**, **GL_RED**, **GL_GREEN**, **GL_BLUE**, **GL_ALPHA**, **GL_RGB**, **GL_LUMINANCE**, and **GL_LUMINANCE_ALPHA** are accepted.

type
: Specifies the data type for *pixels*. Symbolic constants **GL_UNSIGNED_BYTE**, **GL_BYTE**, **GL_BITMAP**, **GL_UNSIGNED_SHORT**, **GL_SHORT**, **GL_UNSIGNED_INT**, **GL_INT**, and **GL_FLOAT** are accepted.

pixels
: Specifies a pointer to the pixel data.

DESCRIPTION

glDrawPixels reads pixel data from memory and writes it into the frame buffer relative to the current raster position. Use **glRasterPos** to set the current raster position, and use **glGet** with argument **GL_CURRENT_RASTER_POSITION** to query the raster position.

Several parameters define the encoding of pixel data in memory and control the processing of the pixel data before it is placed in the frame buffer. These parameters are set with four commands: **glPixelStore**, **glPixelTransfer**, **glPixelMap**, and **glPixelZoom**. This reference page describes the effects on **glDrawPixels** of many, but not all, of the parameters specified by these four commands.

Data is read from *pixels* as a sequence of signed or unsigned bytes, signed or unsigned shorts, signed or unsigned integers, or single-precision floating-point values, depending on *type*. Each of these bytes, shorts, integers, or floating-point values is interpreted as one color or depth component, or one index, depending on *format*. Indices are always treated individually. Color components are treated as groups of one, two, three, or four values, again based on *format*. Both individual indices and groups of components are referred to as pixels. If *type* is **GL_BITMAP**, the data must be unsigned bytes, and *format* must be either **GL_COLOR_INDEX** or **GL_STENCIL_INDEX**. Each unsigned byte is treated as eight 1-bit pixels, with bit ordering determined by **GL_UNPACK_LSB_FIRST** (see **glPixelStore**).

*width*x*height* pixels are read from memory, starting at location *pixels*. By default, these pixels are taken from adjacent memory locations, except that after all *width* pixels are read, the read pointer is advanced to the next four-byte boundary. The four-byte row alignment is specified by **glPixelStore** with argument **GL_UNPACK_ALIGNMENT**, and it can be set to one, two, four, or eight bytes. Other pixel store parameters specify different read pointer advancements, both before the first pixel is read, and after all *width* pixels are read. Refer to the **glPixelStore** reference page for details on these options.

The *width*x*height* pixels that are read from memory are each operated on in the same way, based on the values of several parameters specified by **glPixelTransfer** and **glPixelMap**. The details of these operations, as well as the target buffer into which the pixels are drawn, are specific to the format of the pixels, as specified by *format*. *format* can assume one of eleven symbolic values:

GL_COLOR_INDEX

Each pixel is a single value, a color index. It is converted to fixed-point format, with an unspecified number of bits to the right of the binary point, regardless of the memory type. Floating-point values convert to true fixed-point values. Signed and unsigned integer data is converted with all fraction bits set to zero. Bitmap data convert to either 0.0 or 1.0

Each fixed-point index is then shifted left by **GL_INDEX_SHIFT** bits and added to **GL_INDEX_OFFSET**. If **GL_INDEX_SHIFT** is negative, the shift is to the right. In either case, zero bits fill otherwise unspecified bit locations in the result.

If the GL is in RGBA mode, the resulting index is converted to an RGBA pixel using the **GL_PIXEL_MAP_I_TO_R**, **GL_PIXEL_MAP_I_TO_G**, **GL_PIXEL_MAP_I_TO_B**, and **GL_PIXEL_MAP_I_TO_A** tables. If the GL is in color index mode, and if **GL_MAP_COLOR** is true, the index is replaced with the value that it references in lookup table **GL_PIXEL_MAP_I_TO_I**. Whether the lookup replacement of the index is done or not, the integer part of the index is then ANDed with 2^*b*-1, where *b* is the number of bits in a color index buffer.

The resulting indices or RGBA colors are then converted to fragments by attaching the current raster position *z* coordinate and texture coordinates to each pixel, then assigning *x* and *y* window coordinates to the *n*th fragment, such that:

$$x_n = x_r + n \bmod width$$
$$y_n = y_r + \lfloor n/width \rfloor$$

where (*xr*, *yr*) is the current raster position. These pixel fragments are then treated just like the fragments generated by rasterizing points, lines, or polygons. Texture mapping, fog, and all the fragment operations are applied before the fragments are written to the frame buffer.

GL_STENCIL_INDEX

Each pixel is a single value, a stencil index. It is converted to fixed-point format, with an unspecified number of bits to the right of the binary point, regardless of the memory type. Floating-point values convert to true fixed-point values. Signed and unsigned integer data is converted with all fraction bits set to zero. Bitmap data convert to either 0.0 or 1.0

Each fixed-point index is then shifted left by **GL_INDEX_SHIFT** bits and added to **GL_INDEX_OFFSET**. If **GL_INDEX_SHIFT** is negative, the shift is to the right. In either case, zero bits fill otherwise unspecified bit locations in the result. If **GL_MAP_STENCIL** is true, the index is replaced with the value that it references in lookup table **GL_PIXEL_MAP_S_TO_S**. Whether the lookup replacement of the index is done or not, the integer part of the index is then ANDed with 2^*b*-1, where *b* is the number of bits in the stencil buffer. The resulting stencil indices are then written to the stencil buffer such that the *n*th index is written to location

$$x_n = x_r + n \bmod width$$
$$y_n = y_r + \lfloor n/width \rfloor$$

where (*xr*, *yr*) is the current raster position. Only the pixel ownership test, the scissor test, and the stencil writemask affect these writes.

GL_DEPTH_COMPONENT

Each pixel is a single depth component. Floating-point data is converted directly to an internal floating-point format with unspecified precision. Signed integer data is mapped linearly to the internal floating-point format such that the most postive representable value maps to 1.0, and the most negative representable value maps to -1.0. Unsigned integer data is mapped similarly: the largest integer value maps to 1.0, and zero maps to 0.0. The resulting floating-point depth value is the multiplied by **GL_DEPTH_SCALE** and added to **GL_DEPTH_BIAS**. The result is clamped to the range [0, 1].

The resulting depth components are then converted to fragments by attaching the current raster position color or color index and texture coordinates to each pixel, then assigning *x* and *y* window coordinates to the *n*th fragment, such that:

$$x_n = x_r + n \bmod width$$
$$y_n = y_r + \lfloor n/width \rfloor$$

where (*xr*, *yr*) is the current raster position. These pixel fragments are then treated just like the fragments generated by rasterizing points, lines, or polygons. Texture mapping, fog, and all the fragment operations are applied before the fragments are written to the frame buffer.

GL_RGBA

Each pixel is a four-component group: red first, followed by green, followed by blue, followed by alpha. Floating point values are converted directly to an internal floating-point format with unspecified precision. Signed integer values are mapped linearly to the internal floating-point format such that the most postive representable value maps to 1.0, and the most negative representable value maps to -1.0. Unsigned integer data is mapped similarly: the largest integer value maps to 1.0, and zero maps to 0.0. The resulting floating-point depth value is the multiplied by **GL_*c*_SCALE** and added to **GL_*c*_BIAS**, where *c* is **RED**, **GREEN**, **BLUE** and **ALPHA** for the respective color component. The result is clamped to the range [0, 1].

If **GL_MAP_COLOR** is true, each color component is scaled by the size of lookup table **GL_PIXEL_MAP_*c*_TO_*c***, then replaced by the value that it references in that table. *c* is **R**, **G**, **B**, or **A**, respectively.

The resulting RGBA colors are then converted to fragments by attaching the current raster position *z* coordinate and texture coordinates to each pixel, then assigning *x* and *y* window coordinates to the *n*th fragment, such that:

$$x_n = x_r + n \bmod width$$
$$y_n = y_r + \lfloor n/width \rfloor$$

where (*xr*, *yr*) is the current raster position. These pixel fragments are then treated just like the fragments generated by rasterizing points, lines, or polygons. Texture mapping, fog, and all the fragment operations are applied before the fragments are written to the frame buffer.

GL_RED

Each pixel is a single red component. This component is converted to the internal floating-point format in the same way as the red component of an RGBA pixel is, then it is converted to an RGBA pixel with green and blue set to 0.0 and alpha set to 1.0. After this conversion, the pixel is treated just as if it had been read as an RGBA pixel.

GL_GREEN

Each pixel is a single green component. This component is converted to the internal floating-point format in the same way as the green component of an RGBA pixel is, then it is converted to an RGBA pixel with red and blue set to 0.0 and alpha set to 1.0. After this conversion, the pixel is treated just as if it had been read as an RGBA pixel.

GL_BLUE
Each pixel is a single blue component. This component is converted to the internal floating-point format in the same way as the blue component of an RGBA pixel is, then it is converted to an RGBA pixel with red and green set to 0.0 and alpha set to 1.0. After this conversion, the pixel is treated just as if it had been read as an RGBA pixel.

GL_ALPHA
Each pixel is a single alpha component. This component is converted to the internal floating-point format in the same way as the alpha component of an RGBA pixel is, then it is converted to an RGBA pixel with red, green and blue set to 0.0. After this conversion, the pixel is treated just as if it had been read as an RGBA pixel.

GL_RGB
Each pixel is a three-component group: red first, followed by green, followed by blue. Each component is converted to the internal floating-point format in the same way as the red, green, and blue components of an RGBA pixel are. The color triple is converted to an RGBA pixel with alpha set to 1.0. After this conversion, the pixel is treated just as if it had been read as an RGBA pixel.

GL_LUMINANCE
Each pixel is a single luminance component. This component is converted to the internal floating-point format format in the same way as the red component of an RGBA pixel is, then it is converted to an RGBA pixel with red, green, and blue set to the converted luminance value and alpha set to 1.0. After this conversion, the pixel is treated just as if it had been read as an RGBA pixel.

GL_LUMINANCE_ALPHA
Each pixel is a two component group:luminance first, followed by alpha. The two components are converted to the internal floating-point format format in the same way as the red component of an RGBA pixel is, then they are converted to an RGBA pixel with red, green, and blue set to the converted luminance value and alpha set to the converted alpha value. After this conversion, the pixel is treated just as if it had been read as an RGBA pixel.

The following table summarizes the meaning of the valid constants for the *type* parameter:

type	*corresponding type*
GL_UNSIGNED_BYTE	unsigned 8-bit integer
GL_BYTE	signed 8-bit integer
GL_BITMAP	single bits in unsigned 8-bit integers
GL_UNSIGNED_SHORT	unsigned 16-bit integer
GL_SHORT	signed 16-bit integer
GL_UNSIGNED_INT	unsigned 32-bit integer
GL_INT	32-bit integer
GL_FLOAT	single-precision floating-point

The rasterization described thus far assumes pixel zoom factors of 1.0. If **glPixelZoom** is used to change the *x* and *y* pixel zoom factors, pixels are converted to fragments as follows. If (*xr*, *yr*) is the current raster position, and a given pixel is in the *n*th column and *m*th row of the pixel rectangle, then fragments are generated for pixels whose centers are in the rectangle with corners at

$$(x_r + zoom_x n, y_r + zoom_y m)$$
$$(x_r + zoom_x (n+1), y_r + zoom_y (m+1))$$

where *zoomx* is the value of **GL_ZOOM_X** and *zoomy* is the value of **GL_ZOOM_Y**.

ERRORS

GL_INVALID_VALUE is generated if either *width* or *height* is negative.

GL_INVALID_ENUM is generated if *format* or *type* is not one of the accepted values.

GL_INVALID_OPERATION is generated if *format* is **GL_RED**, **GL_GREEN**, **GL_BLUE**, **GL_ALPHA**, **GL_RGB**, **GL_RGBA**, **GL_LUMINANCE**, or **GL_LUMINANCE_ALPHA**, and the GL is in color index mode.

GL_INVALID_ENUM is generated if *type* is **GL_BITMAP** and *format* is not either **GL_COLOR_INDEX** or **GL_STENCIL_INDEX**.

GL_INVALID_OPERATION is generated if *format* is **GL_STENCIL_INDEX** and there is no stencil buffer.

GL_INVALID_OPERATION is generated if **glDrawPixels** is called between a call to **glBegin** and the corresponding call to **glEnd**.

glDrawBuffer

NAME

glDrawBuffer -- specify which color buffers are to be drawn into

C SPECIFICATION

```
void glDrawBuffer(GLenum mode)
```

PARAMETERS

mode
: Specifies up to four color buffers to be drawn into. Symbolic constants **GL_NONE**, **GL_FRONT_LEFT**, **GL_FRONT_RIGHT**, **GL_BACK_LEFT**, **GL_BACK_RIGHT**, **GL_FRONT**, **GL_BACK**, **GL_LEFT**, **GL_RIGHT**, **GL_FRONT_AND_BACK**, and **GL_AUX***i*, where *i* is between 0 and **GL_AUX_BUFFERS**-1, are accepted. The default value is **GL_FRONT** for single buffered contexts, and **GL_BACK** for double-buffered contexts.

DESCRIPTION

When colors are written to the frame buffer, they are written into the color buffers specified by **glDrawBuffer**. The specifications are as follows:

GL_NONE
: No color buffers are written.

GL_FRONT_LEFT
: Only the front left color buffer is written.

GL_FRONT_RIGHT
: Only the front right color buffer is written.

GL_BACK_LEFT
: Only the back left color buffer is written.

GL_BACK_RIGHT
: Only the back right color buffer is written.

GL_FRONT
: Only the front left and front right color buffers are written. If there is no front right color buffer, only the front left color buffer is written.

GL_BACK
: Only the back left and back right color buffers are written. If there is no back right color buffer, only the back left color buffer is written.

GL_LEFT
: Only the front left and back left color buffers are written. If there is no back left color buffer, only the front left color buffer is written.

GL_RIGHT

Only the front right and back right color buffers are written. If there is no back right color buffer, only the front right color buffer is written.

GL_FRONT_AND_BACK

All the front and back color buffers (front left, front right, back left, back right) are written. If there are no back color buffers, only the front left and front right color buffers are written. If there are no right color buffers, only the front left and back left color buffers are written. If there are no right or back color buffers, only the front left color buffer is written.

GL_AUX*i*

Only auxiliary color buffer *i* is written.

If more than one color buffer is selected for drawing, then blending or logical operations are computed and applied independently for each color buffer and can produce different results in each buffer.

Monoscopic contexts include only *left* buffers, and stereoscopic contexts include both *left* and *right* buffers. Likewise, single-buffered contexts include only *front* buffers, and double-buffered contexts include both *front* and *back* buffers. The context is selected at GL initialization.

NOTES

It is always the case, that **GL_AUX***i* = **GL_AUX**0+*i*.

ERRORS

GL_INVALID_ENUM is generated if *mode* is not an accepted value.

GL_INVALID_OPERATION is generated if none of the buffers indicated by *mode* exists.

GL_INVALID_OPERATION is generated if **glDrawBuffer** is called between a call to **glBegin** and the corresponding call to **glEnd**.

glEnable, glDisable

NAME

glEnable, glDisable -- enable or disable GL capabilities

C SPECIFICATION

```
void glEnable(GLenum cap)
```

PARAMETERS

cap
Specifies a symbolic constant indicating a GL capability.

C SPECIFICATION

```
void glDisable(GLenum cap)
```

PARAMETERS

cap
Specifies a symbolic constant indicating a GL capability.

DESCRIPTION

glEnable and **glDisable** enable and disable various capabilities. Use **glIsEnabled** or **glGet** to determine the current setting of any capability.

Both **glEnable** and **glDisable** take a single argument, *cap*, which can assume one of the following values:

GL_ALPHA_TEST
If enabled, do alpha testing. See **glAlphaFunc**.

AUTO_NORMAL
If enabled, compute surface normal vectors analytically when either **GL_MAP2_VERTEX_3** or **GL_MAP2_VERTEX_4** is used to generate vertices. See **glMap2**.

GL_BLEND
If enabled, blend the incoming RGBA color values with the values in the color buffers. See **glBlendFunc**.

GL_CLIP_PLANE*i*
If enabled, clip geometry against user-defined clipping plane *i*. See **glClipPlane**.

GL_COLOR_MATERIAL
If enabled, have one or more material parameters track the current color. See **glColorMaterial**.

GL_CULL_FACE
If enabled, cull polygons based on their winding in window coordinates. See **glCullFace**.

GL_DEPTH_TEST
If enabled, do depth comparisons and update the depth buffer. See **glDepthFunc** and **glDepthRange**.

GL_DITHER
: If enabled, dither color components or indices before they are written to the color buffer.

GL_FOG
: If enabled, blend a fog color into the posttexturing color. See **glFog**.

GL_LIGHT*i*
: If enabled, include light *i* in the evaluation of the lighting equation. See **glLightModel** and **glLight**.

GL_LIGHTING
: If enabled, use the current lighting parameters to compute the vertex color or index. Otherwise, simply associate the current color or index with each vertex. See **glMaterial**, **glLightModel** and **glLight**.

GL_LINE_SMOOTH
: If enabled, draw lines with correct filtering. Otherwise, draw aliased lines. See **glLineWidth**.

GL_LINE_STIPPLE
: If enabled, use the current line stipple pattern when drawing lines. See **glLineStipple**.

GL_LOGIC_OP
: If enabled, apply the currently selected logical operation to the incoming and and color buffer indices. See **glLogicOp**.

GL_MAP1_COLOR_4
: If enabled, calls to **glEvalCoord1**, **glEvalMesh1** and **glEvalPoint1** will generate RGBA values. See **glMap1**.

GL_MAP1_INDEX
: If enabled, calls to **glEvalCoord1**, **glEvalMesh1** and **glEvalPoint1** will generate color indices. See **glMap1**.

GL_MAP1_NORMAL
: If enabled, calls to **glEvalCoord1**, **glEvalMesh1** and **glEvalPoint1** will generate normals. See **glMap1**.

GL_MAP1_TEXTURE_COORD_1
: If enabled, calls to **glEvalCoord1**, **glEvalMesh1** and **glEvalPoint1** will generate *s* texture coordinates. See **glMap1**.

GL_MAP1_TEXTURE_COORD_2
: If enabled, calls to **glEvalCoord1**, **glEvalMesh1** and **glEvalPoint1** will generate *s* and *t* texture coordinates. See **glMap1**.

GL_MAP1_TEXTURE_COORD_3
: If enabled, calls to **glEvalCoord1**, **glEvalMesh1** and **glEvalPoint1** will generate *s*, *t* and *r* texture coordinates. See **glMap1**.

GL_MAP1_TEXTURE_COORD_4
: If enabled, calls to **glEvalCoord1**, **glEvalMesh1** and **glEvalPoint1** will generate *s*, *t*, *r* and *q* texture coordinates. See **glMap1**.

GL_MAP1_VERTEX_3
: If enabled, calls to **glEvalCoord1**, **glEvalMesh1** and **glEvalPoint1** will generate *x*, *y* and *z* vertex coordinates. See **glMap1**.

GL_MAP1_VERTEX_4
: If enabled, calls to **glEvalCoord1**, **glEvalMesh1** and **glEvalPoint1** will generate homogeneous *x*, *y*, *z* and *w* vertex coordinates. See **glMap1**.

GL_MAP2_COLOR_4
If enabled, calls to **glEvalCoord2**, **glEvalMesh2** and **glEvalPoint2** will generate RGBA values. See **glMap2**.

GL_MAP2_INDEX
If enabled, calls to **glEvalCoord2**, **glEvalMesh2** and **glEvalPoint2** will generate color indices. See **glMap2**.

GL_MAP2_NORMAL
If enabled, calls to **glEvalCoord2**, **glEvalMesh2** and **glEvalPoint2** will generate normals. See **glMap2**.

GL_MAP2_TEXTURE_COORD_1
If enabled, calls to **glEvalCoord2**, **glEvalMesh2** and **glEvalPoint2** will generate *s* texture coordinates. See **glMap2**.

GL_MAP2_TEXTURE_COORD_2
If enabled, calls to **glEvalCoord2**, **glEvalMesh2** and **glEvalPoint2** will generate *s* and *t* texture coordinates. See **glMap2**.

GL_MAP2_TEXTURE_COORD_3
If enabled, calls to **glEvalCoord2**, **glEvalMesh2** and **glEvalPoint2** will generate *s*, *t* and *r* texture coordinates. See **glMap2**.

GL_MAP2_TEXTURE_COORD_4
If enabled, calls to **glEvalCoord2**, **glEvalMesh2** and **glEvalPoint2** will generate *s*, *t*, *r* and *q* texture coordinates. See **glMap2**.

GL_MAP2_VERTEX_3
If enabled, calls to **glEvalCoord2**, **glEvalMesh2** and **glEvalPoint2** will generate *x*, *y* and *z* vertex coordinates. See **glMap2**.

GL_MAP2_VERTEX_4
If enabled, calls to **glEvalCoord2**, **glEvalMesh2** and **glEvalPoint2** will generate homogeneous *x*, *y*, *z* and *w* vertex coordinates. See **glMap2**.

GL_NORMALIZE
If enabled, normal vectors specified with **glNormal** are scaled to unit length after transformation. See **glNormal**.

GL_POINT_SMOOTH
If enabled, draw points with proper filtering. Otherwise, draw aliased points. See **glPointSize**.

GL_POLYGON_SMOOTH
If enabled, draw polygons with proper filtering. Otherwise, draw aliased polygons. See **glPolygonMode**.

GL_POLYGON_STIPPLE
If enabled, use the current polygon stipple patttern when rendering polygons. See **glPolygonStipple**.

GL_SCISSOR_TEST
If enabled, discard fragments that are outside the scissor rectangle. See **glScissor**.

GL_STENCIL_TEST
If enabled, do stencil testing and update the stencil buffer. See **glStencilFunc** and **glStencilOp**.

GL_TEXTURE_1D
If enabled, one-dimensional texturing is performed (unless two-dimensional texturing is also enabled). See **glTexImage1D**.

GL_TEXTURE_2D

If enabled, two-dimensional texturing is performed. See **glTexImage2D**.

GL_TEXTURE_GEN_Q

If enabled, the *q* texture coordinate is computed using the texture generation function defined with **glTexGen**. Otherwise, the current *q* texture coordinate is used. See **glTexGen**.

GL_TEXTURE_GEN_R

If enabled, the *r* texture coordinate is computed using the texture generation function defined with **glTexGen**. Otherwise, the current *r* texture coordinate is used. See **glTexGen**.

GL_TEXTURE_GEN_S

If enabled, the *s* texture coordinate is computed using the texture generation function defined with **glTexGen**. Otherwise, the current *s* texture coordinate is used. See **glTexGen**.

GL_TEXTURE_GEN_T

If enabled, the *t* texture coordinate is computed using the texture generation function defined with **glTexGen**. Otherwise, the current *t* texture coordinate is used. See **glTexGen**.

ERRORS

GL_INVALID_ENUM is generated if *cap* is not one of the values listed above.

GL_INVALID_OPERATION is generated if **glEnable** is called between a call to **glBegin** and the corresponding call to **glEnd**.

glEdgeFlag

NAME

glEdgeFlag -- flag edges as either boundary or nonboundary

C SPECIFICATION

```
void glEdgeFlag(GLboolean flag)
```

PARAMETERS

flag
: Specifies the current edge flag value, either true or false.

C SPECIFICATION

```
void glEdgeFlagv(const GLboolean *flag)
```

PARAMETERS

flag
: Specifies a pointer to an array that contains a single Boolean element, which replaces the current edge flag.

DESCRIPTION

Each vertex of a polygon, separate triangle, or separate quadriliteral specified between a **glBegin**/ **glEnd** pair is marked as the start of either a boundary or nonboundary edge. If the current edge flag is true when the vertex is specified, the vertex is marked as the start of a boundary edge. Otherwise, the vertex is marked as start of a nonboundary edge. **glEdgeFlag** sets the edge flag to true if *flag* is nonzero, false otherwise.

The vertices of connected triangles and connected quadriliterals are always marked as boundary, regardless of the value of the edge flag.

Boundary and nonboundary edge flags on vertices are significant only if **GL_POLYGON_MODE** is set to **GL_POINT** or **GL_LINE**. See **glPolygonMode**.

Initially, the edge flag is true.

NOTES

The current edge flag can be updated at any time. In particular, **glEdgeFlag** can be called between a call to **glBegin** and the corresponding call to **glEnd**.

glNewList, glEndList

NAME

glNewList, **glEndList** -- create or replace a display list

C SPECIFICATION

```
void glNewList(GLuint list,
               GLenum mode)
```

PARAMETERS

list
: Specifies the display list name.

mode
: Specifies the compilation mode, which can be **GL_COMPILE** or **GL_COMPILE_AND_EXECUTE**.

C SPECIFICATION

```
void glEndList(void void)
```

DESCRIPTION

Display lists are groups of GL commands that have been stored for subsequent execution. The display lists are created with **glNewList**. All subsequent commands are placed in the display list, in the order issued, until **glEndList** is called.

glNewList has two arguments. The first argument, *list*, is a positive integer that becomes the unique name for the display list. Names can be created and reserved with **glGenLists** and tested for uniqueness with **glIsList**. The second argument, *mode*, is a symbolic constant that can assume one of two values:

GL_COMPILE
: Commands are merely compiled.

GL_COMPILE_AND_EXECUTE
: Commands are executed as they are compiled into the display list.

Certain commands are not compiled into the display list, but are executed immediately, regardless of the display-list mode. These commands are **glIsList**, **glGenLists**, **glDeleteList**, **glFeedbackBuffer**, **glSelectBuffer**, **glRenderMode**, **glReadPixels**, **glPixelStore**, **glFlush**, **glFinish**, **glIsEnabled**, and all of the **glGet** routines.

When **glEndList** is encountered, the display-list definition is completed by associating the list with the unique name list (specified in the **glNewList** command). If a display list with name list already exists, it is replaced only when **glEndList** is called.

NOTES

glCallList and **glCallLists** can be entered into display lists. The commands in the display list or lists executed by **glCallList** or **glCallLists** are not included in the display list being created, even if the list creation mode is **GL_COMPILE_AND_EXECUTE**.

ERRORS

GL_INVALID_VALUE is generated if *list* is zero.

GL_INVALID_ENUM is generated if *mode* is not an accepted value.

GL_INVALID_OPERATION is generated if **glEndList** is called without a preceding **glNewList**, or if **glNewList** is called while a display list is being defined.

GL_INVALID_OPERATION is generated if **glNewList** is called between a call to **glBegin** and the corresponding call to **glEnd**.

glBegin, glEnd

NAME

glBegin, **glEnd** -- delimit the vertices of a primitive or a group of like primitives

C SPECIFICATION

```
void glBegin(GLenum mode)
```

PARAMETERS

mode
: Specifies the primitive or primitives that will be created from vertices presented between **glBegin** and the subsequent **glEnd**. Ten symbolic constants are accepted: **GL_POINTS**, **GL_LINES**, **GL_LINE_STRIP**, **GL_LINE_LOOP**, **GL_TRIANGLES**, **GL_TRIANGLE_STRIP**, **GL_TRIANGLE_FAN**, **GL_QUADS**, **GL_QUAD_STRIP**, and **GL_POLYGON**.

C SPECIFICATION

```
void glEnd(void)
```

DESCRIPTION

glBegin and **glEnd** delimit the verties that define a primitive or a group of like primitives. **glBegin** accepts a single argument that specifies which of ten ways the vertices are interpreted. Taking *n* as the integer count starting at one, and *N* as the total number of vertices specified, the interpretations are as follows:

GL_POINTS
: Treats each vertex as a single point. Vertex *n* defines point *n*. *N* points are drawn.

GL_LINES
: Treats each pair of vertices as an independent line segment. Vertices *2n-1* and *2n* define line *n*. *N/2* lines are drawn.

GL_LINE_STRIP
: Draws a connected group of line segments from the first vertex to the last. Vertices *n* and *n+1* define line *n*. *N-1* lines are drawn.

GL_LINE_LOOP
: Draws a connected group of line segments from the first vertex to the last, then back to the first. Vertices *n* and *n+1* define line *n*. The last line however, is defined by vertices *N* and *1*. *N* lines are drawn.

GL_TRIANGLES
: Treats each triplet of vertices as an independent triangle. Vertices *3n-2*, *3n-1*, and *3n* define triangle *n*. *N/3* triangles are drawn.

GL_TRIANGLE_STRIP
: Draws a connected group of triangles. One triangle is defined for each vertex presented after the first two vertices. For odd *n*, vertices *n*, *n+1*, and *n+2* define triangle *n*. For even *n*, vertices *n+1*, *n*, and *n+2* define triangle *n*. *N-2* triangles are drawn.

GL_TRIANGLE_FAN
Draws a connected group of triangles. One triangle is defined for each vertex presented after the first two vertices. Vertices *1*, *n+1*, and *n+2* define triangle *n*. *N-2* triangles are drawn.

GL_QUADS
Treats each group of four vertices as an independent quadriliteral. Vertices *4n-3*, *4n-2*, *4n-1*, and *4n* define quadriliteral *n*. *N/4* quadriliterals are drawn.

GL_QUAD_STRIP
Draws a connected group of quadriliterals. One quadriliteral is defined for each pair of vertices presented after the first pair. Vertices *2n-1*, *2n*, *2n+2*, and *2n+1* define quadriliteral *n*. *N/2-1* quadriliterals are drawn. Note that the order in which vertices are used to construct a quadriliteral from strip data is different from that used with independent data.

GL_POLYGON
Draws a single, convex polygon. Vertices *1* through *N* define this polygon.

Only a subset of GL commands can be used betwen **glBegin** and **glEnd**. The commands are **glVertex**, **glColor**, **glIndex**, **glNormal**, **glTexCoord**, **glEvalCoord**, **glEvalPoint**, **glMaterial**, and **glEdgeFlag**. Also, it is acceptable to use **glCallList** or **glCallLists** to execute display lists that include only the preceeding commands. If any other GL command is called between **glBegin** and **glEnd**, the error flag is set and the command is ignored.

Regardless of the value chosen for *mode*, there is no limit to the number of vertices that can be defined betwen **glBegin** and **glEnd**. Lines, triangles, quadriliterals, and polygons that are incompletely specified are not drawn. Incomplete specification results when either too few vertices are provided to specify even a single primitive or when an incorrect multiple of vertices is specified. The incomplete primitive is ignored; the rest are drawn.

The minimum specification of vertices for each primitive is as follows: 1 for a point, 2 for a line, 3 for a triangle, 4 for a quadriliteral, and 3 for a polygon. Modes that require a certain multiple of vertices are **GL_LINES** (2), **GL_TRIANGLES** (3), **GL_QUADS** (4), and **GL_QUAD_STRIP** (2).

ERRORS

GL_INVALID_ENUM is generated if *mode* is set to an unaccepted value.

GL_INVALID_OPERATION is generated if a command other than **glVertex**, **glColor**, **glIndex**, **glNormal**, **glTexCoord**, **glEvalCoord**, **glEvalPoint**, **glMaterial**, **glEdgeFlag**, **glCallList** or **glCallLists** is called between **glBegin** and the corresponding **glEnd**.

GL_INVALID_OPERATION is generated if **glEnd** is called before the corresponding **glBegin** is called.

glEvalMesh

NAME

glEvalMesh1, glEvalMesh2 -- compute a one- or two-dimensional grid of points or lines

C SPECIFICATION

```
void glEvalMesh1(GLenum mode,
                 GLint i1,
                 GLint i2)
```

PARAMETERS

mode
: In **glEvalMesh1**, specifies whether to compute a one-dimensional mesh of points or lines. Symbolic constants **GL_POINT** and **GL_LINE** are accepted.

i1, *i2*
: Specify the first and last integer values for grid domain variable *i*.

C SPECIFICATION

```
void glEvalMesh2(GLenum mode,
                 GLint i1,
                 GLint i2,
                 GLint j1,
                 GLint j2)
```

PARAMETERS

mode
: In **glEvalMesh2**, specifies whether to compute a two-dimensional mesh of points, lines or polygons. Symbolic constants **GL_POINT**, **GL_LINE**, and **GL_FILL** are accepted.

i1, *i2*
: Specify the first and last integer values for grid domain variable *i*.

j1, *j2*
: Specify the first and last integer values for grid domain variable *j*.

DESCRIPTION

glMapGrid and **glEvalMesh** are used in tandem to efficiently generate and evaluate a series of evenly spaced map domain values. **glEvalMesh** steps through the integer domain of a one- or two-dimensional grid, whose range is the domain of the evaluation maps specified by **glMap1** and **glMap2**. *mode* determines whether the resulting vertices are connected as points, lines, or filled polygons. In the one-dimensional case, **glEvalMesh1**, the mesh is generated as if the following code fragment were executed:

```
glBegin(type);
for (i = i1; i <= i2; i += 1)
    glEvalCoord1(i*du+u1)
glEnd();
```

where

$$du = (u2-u1)/n$$

and *n*, *u1*, and *u2* are the arguments to the most recent **glMapGrid1** command. *type* is **GL_POINTS** if *mode* is **GL_POINT**, or **GL_LINES** if *mode* is **GL_LINE**. The one absolute numeric requirement is that if $i = n$, then the value computed from $i*du+u1$ is exactly *u2*.

In the two-dimensional case, **glEvalMesh2**, let

$$du = (u2-u1)/n$$
$$dv = (v2-v1)/m,$$

where *n*, *u1*, *u2*, *m*, *v1*, and *v2* are the arguments to the most recent **glMapGrid2** command. Then, if *mode* is **GL_FILL**, the **glEvalMesh2** command is equivalent to:

```
for (j = j1; j < j2; j += 1) {
    glBegin(GL_QUAD_STRIP);
    for (i = i1; i <= i2; i += 1) {
        glEvalCoord2(i*du+u1, j*dv+v1);
        glEvalCoord2(i*du+u1, (j+1)*dv+v1);

    }
    glEnd();
}
```

If *mode* is **GL_LINE**, then a call to **glEvalMesh2** is equivalent to:

```
for (j = j1; j <= j2; j += 1) {
    glBegin(GL_LINE_STRIP);
    for (i = i1; i <= i2; i += 1)
        glEvalCoord2(i*du+u1, j*dv+v1);
    glEnd();
}
for (i = i1; i <= i2; i += 1) {
    glBegin(GL_LINE_STRIP);
    for (j = j1; j <= j2; j += 1)
        glEvalCoord2(i*du+u1, j*dv+v1);
    glEnd();
}
```

And finally, if *mode* is **GL_POINT**, then a call to **glEvalMesh2** is equivalent to:

```
glBegin(GL_POINTS);
for (j = j1; j <= j2; j += 1) {
    for (i = i1; i <= i2; i += 1) {
        glEvalCoord2(i*du+u1, j*dv+v1);
    }
}
glEnd();
```

In all three cases, the only absolute.numeric requirements are that if $i = n$, then the value computed from $i*du+u1$ is exactly *u2*, and if $j = m$, then the value computed from $j*dv+v1$ is exactly *v2*.

ERRORS

GL_INVALID_ENUM is generated if *mode* is not an accepted value.

GL_INVALID_OPERATION is generated if **glEvalMesh** is called between a call to **glBegin** and the corresponding call to **glEnd**.

glEvalCoord

NAME

glEvalCoord1d, **glEvalCoord1f**, **glEvalCoord2d**, **glEvalCoord2f**, **glEvalCoord1dv**, **glEvalCoord1fv**, **glEvalCoord2dv**, **glEvalCoord2fv** -- evaluate enabled one- and two-dimensional maps

C SPECIFICATION

```
void glEvalCoord1d(GLdouble u)
void glEvalCoord1f(GLfloat u)
void glEvalCoord2d(GLdouble u,
                   GLdouble v)
void glEvalCoord2f(GLfloat u,
                   GLfloat v)
```

PARAMETERS

u

Specifies a value that is the domain coordinate *u* to the basis function defined in a previous **glMap1** or **glMap2** command.

v

Specifies a value that is the domain coordinate *v* to the basis function defined in a previous **glMap2** command. This argument is not present in an **glEvalCoord1** command.

C SPECIFICATION

```
void glEvalCoord1dv(const GLdouble *u)
void glEvalCoord1fv(const GLfloat *u)
void glEvalCoord2dv(const GLdouble *u)
void glEvalCoord2fv(const GLfloat *u)
```

PARAMETERS

u

Specifies a pointer to an array containig either one or two domain coordinates. The first coordinate is *u*. The second coordinate is *v*, which is present only in **glEvalCoord2** versions.

DESCRIPTION

glEvalCoord1 evaluates enabled one-dimensional maps at argument *u*. **glEvalCoord2** does the same for two-dimensional maps using two domain values, *u* and *v*. Maps are defined with **glMap1** and **glMap2** and enabled and disabled with **glEnable** and **glDisable**.

When one of the **glEvalCoord** commands is issued, all currently enabled maps of the indicated dimension are evaluated. Then, for each evaluated map, it is as if the corresponding GL command was issued with the computed value. That is, if **GL_MAP1_INDEX** or **GL_MAP2_INDEX** is enabled, a **glIndex** command is simulated. If **GL_MAP1_COLOR_4** or **GL_MAP2_COLOR_4** is enabled, a **glColor** command is simulated. If **GL_MAP1_NORMAL** or **GL_MAP2_NORMAL** is enabled, a normal vector is produced, and if any of **GL_MAP1_TEXTURE_COORD_1**, **GL_MAP1_TEXTURE_COORD_2**, **GL_MAP1_TEXTURE_COORD_3**, **GL_MAP1_TEXTURE_COORD_4**, **GL_MAP2_TEXTURE_COORD_1**, **GL_MAP2_TEXTURE_COORD_2**, **GL_MAP2_TEXTURE_COORD_3**, or **GL_MAP2_TEXTURE_COORD_4** is enabled, then an appropriate **glTex** command is simulated.

The GL uses evaluated values instead of current values for those evaluations that are enabled, and current values otherwise, for color, color index, normal, and texture coordinates. However, the evaluated values do not update the current values. Thus, if **glVertex** commands are interspersed with **glEvalCoord** commands, the color, normal, and texture coordinates associated with the **glVertex** commands are not affected by the values generated by the **glEvalCoord** commands, but rather only by the most recent **glColor**, **glIndex**, **glNormal**, and **glTexCoord** commands.

No commands are issued for maps that are not enabled. If more than one texture evaluation is enabled for a particular dimension (for example **GL_MAP2_TEXTURE_COORD_1** and **GL_MAP2_TEXTURE_COORD_2**), then only the evaluation of the map that produces the larger number of coordinates (in this case, **GL_MAP2_TEXTURE_COORD_2**) is carried out. **GL_MAP1_VERTEX_4** overrides **GL_MAP1_VERTEX_3**, and **GL_MAP2_VERTEX_4** overrides **GL_MAP2_VERTEX_3**, in the same manner. If neither a three- nor four-component vertex map is enabled for the specified dimension, the **glEvalCoord** command is ignored.

If automatic normal generation is enabled, by calling **glEnable** with argument **GL_AUTO_NORMAL**, **glEvalCoord2** generates surface normals analytically, regardless of the contents or enabling of the **GL_MAP2_NORMAL** map. Let

$$m = \frac{\partial p}{\partial u} \times \frac{\partial p}{\partial v}$$

Then the generated normal *n* is

$$n = \frac{m}{||m||}$$

If automatic normal generation is disabled, the corresponding normal map **GL_MAP2_NORMAL**, if enabled, is used to produce a normal. If neither automatic normal generation nor a normal map is enabled, no normal is generated for **glEvalCoord2** commands.

glFeedbackBuffer

NAME

glFeedbackBuffer -- controls feedback mode

C SPECIFICATION

```
void glFeedbackBuffer(GLsizei size,
                      GLenum type,
                      GLfloat *buffer)
```

PARAMETERS

size
: Specifies the maximum number of values that can be written into *buffer*.

type
: Specifies a symbolic constant that describes the information that will be returned for each vertex. **GL_2D**, **GL_3D**, **GL_3D_COLOR**, **GL_3D_COLOR_TEXTURE**, and **GL_4D_COLOR_TEXTURE** are accepted.

buffer
: Returns the feedback data.

DESCRIPTION

The **glFeedbackBuffer** function controls feedback. Feedback, like selection, is a GL mode. The mode is selected by calling **glRenderMode** with **GL_FEEDBACK**. When the GL is in feedback mode, no pixels are produced by rasterization. Instead, information about primitives that would have been rasterized is fed back to the application using the GL.

glFeedbackBuffer has three arguments: *buffer* is a pointer to an array of floating-point values into which feedback information is placed. *size* indicates the size of the array. *type* is a symbolic constant describing the information that is fed back for each vertex. **glFeedbackBuffer** must be issued before feedback mode is enabled (by calling **glRenderMode** with argument **GL_FEEDBACK**). Setting **GL_FEEDBACK** without establishing the feedback buffer, or calling **glFeedbackBuffer** while the GL is in feedback mode, is an error.

The GL is taken out of feedback mode by calling **glRenderMode** with a parameter value other than **GL_FEEDBACK**. When this is done while the GL is in feedback mode, **glRenderMode** returns the number of entries placed in the feedback array. The returned value never exceeds *size*. If the feedback data required more room than was available in *buffer*, **glRenderMode** returns a negative value.

While in feedback mode, each primitive that would be rasterized generates a block of values that get copied into the feedback array. If doing so would cause the number of entries to exceed the maximum, the block is partially written so as to fill the array (if there is any room left at all), and an overflow flag is set. Each block begins with a code indicating the primitive type, followed by values that describe the primitive's vertices and associated data. Entries are also written for bitmaps and pixel rectangles. Feedback occurs after polygon culling and **glPolyMode** interpretation of polygons has taken place, so polygons that are culled are not returned in the feedback buffer. It can also occur after polygons with more than three edges are broken up into triangles, if the GL implementation renders polygons by performing this decomposition.

The **glPassThrough** command can be used to insert a marker into the feedback buffer. See **glPassThrough**.

Following is the grammar for the blocks of values written into the feedback buffer. Each primitive is indicated with a unique identifying value followed by some number of vertices. Polygon entries include an integer value indicating how many vertices follow. A vertex is fed back as some number of floating-point values, as determined by *type*. Colors are fed back as four values in RGBA mode and one value in color index mode.

```
feedbackList <- feedbackItem feedbackList | feedbackItem

feedbackItem <- point | lineSegment | polygon | bitmap |
pixelRectangle | passThru

point <- GL_POINT_TOKEN vertex

lineSegment <- GL_LINE_TOKEN vertex vertex | GL_LINE_RESET_TOKEN
vertex vertex

polygon <- GL_POLYGON_TOKEN n polySpec

polySpec <- polySpec vertex | vertex vertex vertex

bitmap <- GL_BITMAP_TOKEN vertex

pixelRectangle <- GL_DRAW_PIXEL_TOKEN vertex | GL_COPY_PIXEL_TOKEN
vertex

passThru <- GL_PASS_THROUGH_TOKEN value

vertex <- 2d | 3d | 3dColor | 3dColorTexture | 4dColorTexture

2d <- value value

3d <- value value value

3dColor  <- value value value        color

3dColorTexture <- value value        value color tex

4dColorTexture <- value value        value value color tex

color <- rgba | index

rgba <- value        value value value

index <- value

tex <- value value value value
```

value is a floating-point number, and *n* is a floating-point integer giving the number of vertices in the polygon. **GL_POINT_TOKEN**, **GL_LINE_TOKEN**, **GL_LINE_RESET_TOKEN**, **GL_POLYGON_TOKEN**, **GL_BITMAP_TOKEN**, **GL_DRAW_PIXEL_TOKEN**, **GL_COPY_PIXEL_TOKEN** and **GL_PASS_THROUGH_TOKEN** are symbolic floating-point constants. **GL_LINE_RESET_TOKEN** is returned whenever the line stipple pattern is reset. The data returned as a vertex depends on the feedback *type*.

The following table gives the correspondence between *type* and the number of values per vertex. *k* is 1 in color index mode and 4 in RGBA mode.

type	*coordinates*	*color*	*texture*	*total number of values*
GL_2D	x, y			2
GL_3D	x, y, z			3
GL_3D_COLOR	x, y, z	k		$3+k$
GL_3D_COLOR_TEXTURE	x, y, z	k	4	$7+k$
GL_4D_COLOR_TEXTURE	x, y, z, w	k	4	$8+k$

Feedback vertex coordinates are in window coordinates, except *w*, which is in clip coordinates. Feedback colors are lighted, if lighting is enabled. Feedback texture coordinates are generated, if texture coordinate generation is enabled. They are always transformed by the texture matrix.

NOTES

glFeedbackBuffer, when used in a display list, is not compiled into the display list but rather is executed immediately.

ERRORS

GL_INVALID_ENUM is generated if *type* is not an accepted value.

GL_INVALID_VALUE is generated if *size* is negative.

GL_INVALID_OPERATION is generated if **glFeedbackBuffer** is called while the render mode is **GL_FEEDBACK**, or if **glRenderMode** is called with argument **GL_FEEDBACK** before **glFeedbackBuffer** is called at least once.

GL_INVALID_OPERATION is generated if **glFeedbackBuffer** is called between a call to **glBegin** and the corresponding call to **glEnd**.

glEvalPoint

NAME

glEvalPoint1, glEvalPoint2 -- generate and evaluate a single point in a mesh

C SPECIFICATION

```
void glEvalPoint1(GLint i)
void glEvalPoint2(GLint i,
                  GLint j)
```

PARAMETERS

i
: Specifies the integer value for grid domain variable *i*.

j
: Specifies the integer value for grid domain variable *j* (**glEvalPoint2** only).

DESCRIPTION

glMapGrid and **glEvalMesh** are used in tandem to efficiently generate and evaluate a series of evenly spaced map domain values. **glEvalPoint** can be used to evaluate a single grid point in the same gridspace that is traversed by **glEvalMesh**. Calling **glEvalPoint1** is equivalent to calling

glEvalCoord1($i*du+u1$);

where

$$du = (u2-u1)/n$$

and n, $u1$, and $u2$ are the arguments to the most recent **glMapGrid1** command. The one absolute numeric requirement is that if $i = n$, then the value computed from $i*du+u1$ is exactly $u2$.

In the two-dimensional case, **glEvalPoint2**, let

$$du = (u2-u1)/n$$

$$dv = (v2-v1)/m$$

where n, $u1$, $u2$, m, $v1$, and $v2$ are the arguments to the most recent **glMapGrid2** command. Then the **glEvalPoint2** command is equivalent to calling

glEvalCoord2($i*du+u1$, $j*dv+v1$);

The only absolute numeric requirements are that if $i = n$, then the value computed from $i*du+u1$ is exactly $u2$, and if $j = m$, then the value computed from $j*dv+v1$ is exactly $v2$.

glFlush

NAME

glFlush -- force execution of GL commands in finite time

C SPECIFICATION

`void **glFlush**(void *void*)`

DESCRIPTION

Different GL implementations buffer commands in several different locations, including network buffers and the graphics accelerator itself. **glFlush** empties all of these buffers, causing all issued commands to be executed as quickly as they are accepted by the actual rendering engine. Though this execution may not be completed in any particular time period, it does complete in finite time.

Because any GL program might be executed over a network, or on an accelerator that buffers commands, all programs should call **glFlush** whenever they count on having all of their previously issued commands completed. For example, call **glFlush** before waiting for user input that depends on the generated image.

NOTES

glFlush can return at any time. It does not wait until the execution of all previously issued GL commands is complete.

ERRORS

GL_INVALID_OPERATION is generated if **glFlush** is called between a call to **glBegin** and the corresponding call to **glEnd**.

SEE ALSO

glFinish

---

back to the **OpenGL index page**

---

glFinish

NAME

glFinish -- block until all GL execution is complete

C SPECIFICATION

```
void glFinish(void void)
```

DESCRIPTION

glFinish does not return until the effects of all previously called GL commands are complete. Such effects include all changes to GL state, all changes to connection state, and all changes to the frame buffer contents.

NOTES

glFinish requires a round trip to the server

ERRORS

GL_INVALID_OPERATION is generated if **glFinish** is called between a call to **glBegin** and the corresponding call to **glEnd**.

---

glFrontFace

NAME

glFrontFace -- define front- and back-facing polygons

C SPECIFICATION

```
void glFrontFace(GLenum mode)
```

PARAMETERS

mode
: Specifies the orientation of front-facing polygons. **GL_CW** and **GL_CCW** are accepted. The default value is **GL_CCW**.

DESCRIPTION

In a scene composed entirely of opaque closed surfaces, back-facing polygons are never visible. Eliminating these invisible polygons has the obvious benefit of speeding up the rendering of the image. Elimination of back-facing polygons is enabled and disabled with **glEnable** and **glDisable** using argument **GL_CULL_FACE**.

The projection of a polygon to window coordinates is said to have clockwise winding if an imaginary object following the path from its first vertex, its second vertex, and so on, to its last vertex, and finally back to its first vertex, moves in a clockwise direction about the interior of the polygon. The polygon's winding is said to be counterclockwise if the imaginary object following the same path moves in a counterclockwise direction about the interior of the polygon. **glFrontFace** specifies whether polygons with clockwise winding in window coordinates, or counterclockwise winding in window coordinates, are taken to be front-facing. Passing **GL_CCW** to mode selects counterclockwise polygons as front-facing; **GL_CW** selects clockwise polygons as frontfacing. By default, counterclockwise polygons are taken to be frontfacing.

ERRORS

GL_INVALID_ENUM is generated if *mode* is not an accepted value.

GL_INVALID_OPERATION is generated if **glFrontFace** is called between a call to **glBegin** and the corresponding call to **glEnd**.

glFog

NAME

glFogf, glFogi, glFogfv, glFogiv -- specify fog parameters

C SPECIFICATION

```
void glFogf(GLenum pname,
            GLfloat param)
void glFogi(GLenum pname,
            GLint param)
```

PARAMETERS

pname
: Specifies a single-valued fog parameter. **GL_FOG_MODE**, **GL_FOG_DENSITY**, **GL_FOG_START**, **GL_FOG_END**, and **GL_FOG_INDEX** are accepted.

param
: Specifies the value that *pname* will be set to.

C SPECIFICATION

```
void glFogfv(GLenum pname,
             const GLfloat *params)
void glFogiv(GLenum pname,
             const GLint *params)
```

PARAMETERS

pname
: Specifies a fog parameter. **GL_FOG_MODE**, **GL_FOG_DENSITY**, **GL_FOG_START**, **GL_FOG_END**, **GL_FOG_INDEX**, and **GL_FOG_COLOR** are accepted.

param
: Specifies the value or values to be assigned to *pname*. **GL_FOG_COLOR** requires an array of four values. All other parameters accept an array containing only a single value.

DESCRIPTION

Fog is enabled and disabled with **glEnable** and **glDisable**using the argument **GL_FOG**. While enabled, fog affects rasterized geometry, bitmaps, and pixel blocks, but not buffer clear operations.

glFog assigns the value or values in params to the fog parameter specified by pname. The accepted values for pname are as follows:

GL_FOG_MODE
: *params* is a single integer or floating-point value that specifies the equation to be used to compute the fog blend factor, *f*. Three symbolic constants are accepted: **GL_LINEAR**, **GL_EXP**, and **GL_EXP2**. The equations corresponding to these symbolic constants are defined below. The default fog mode is **GL_EXP**.

GL_FOG_DENSITY

params is a single integer or floating-point value that specifies *density*, the fog density used in both exponential fog equations. Only nonnegative densities are accepted. The default fog density is 1.0.

GL_FOG_START

params is a single integer or floating-point value that specifies *start*, the near distance used in the linear fog equation. The default near distance is 0.0.

GL_FOG_END

params is a single integer or floating-point value that specifies *end*, the far distance used in the linear fog equation. The default far distance is 1.0.

GL_FOG_INDEX

params is a single integer or floating-point value that specifies *if*, the fog color index. The default fog index is 0.0.

GL_FOG_COLOR

params contains four integer or floating-point values that specify *Cf*, the fog color. Integer values are mapped linearly such that the most positive representable value maps to 1.0, and the most negative representable value maps to -1.0. Floating-point values are mapped directly. After conversion, all color components are clamped to the range [0, 1]. The default fog color is (0,0,0,0).

Fog blends a fog color with each rasterized pixel fragment's posttexturing color using a blending factor *f*. Factor *f* is computed in one of three ways, depending on the fog mode. Let *z* be the distance in eye coordinates from the origin to the fragment being fogged. The equation for **GL_LINEAR** fog is

$$f = \frac{end - z}{end - start}$$

The equation for **GL_EXP** fog is

$$f = e^{(-density \cdot z)}$$

The equation for **GL_EXP2** fog is

$$f = e^{(-density \cdot z)^2}$$

Regardless of the fog mode, *f* is clamped to the range [0 ,1] after it is computed. Then, if the GL is in RGBA color mode, the fragment's color *Cr* is replaced by

$$Cr' = f*Cr+(1-f)*Cf$$

In color index mode, the fragment's color index *ir* is replaced by

$$ir' = f*ir+(1-f)*if$$

ERRORS

GL_INVALID_ENUM is generated if *pname* is not an accepted value.

GL_INVALID_OPERATION is generated if **glFog** is called between a call to **glBegin** and the corresponding call to **glEnd**.

glGenLists

NAME

glGenLists -- generate a contiguous set of empty display lists

C SPECIFICATION

```
GLuint glGenLists(GLsizei range)
```

PARAMETERS

range
    Specifies the number of contiguous empty display lists to be generated.

DESCRIPTION

glGenLists has one argument, *range*. It returns an integer *n* such that *range* contiguous empty display lists, named *n*, *n*+1, ..., *n*+*range*-1, are created. If *range* is zero, if there is no group of *range* contiguous names available, or if any error is generated, no display lists are generated, and zero is returned.

ERRORS

GL_INVALID_VALUE is generated if *range* is negative.

GL_INVALID_OPERATION is generated if **glGenLists** is called between a call to **glBegin** and the corresponding call to **glEnd**.

ASSOCIATED GETS

glFrustum

NAME

glFrustum -- multiply the current matrix by a perspective matrix

C SPECIFICATION

```
void glFrustum(GLdouble left,
               GLdouble right,
               GLdouble bottom,
               GLdouble top,
               GLdouble near,
               GLdouble far)
```

PARAMETERS

left, *right*
: Specify the coordinates for the left and right vertical clipping planes.

bottom, *top*
: Specify the coordinates for the bottom and top horizontal clipping planes.

near, *far*
: Specify the distances to the near and far depth clipping planes. Both distances must be positive.

DESCRIPTION

glFrustum describes a perspective matrix that produces a perspective projection. (*left*,*bottom*,-*near*) and (*right*,*top*,-*near*) specify the points on the near clipping plane that are mapped to the lower left and upper right corners of the window, respectively, assuming that the eye is located at (0, 0, 0). -*far* specifies the location of the far clipping plane. Both *near* and *far* must be positive. The corresponding matrix is

$$\begin{pmatrix} \frac{2\,near}{right-left} & 0 & A & 0 \\ 0 & \frac{2\,near}{top-bottom} & B & 0 \\ 0 & 0 & C & D \\ 0 & 0 & -1 & 0 \end{pmatrix}$$

$$A = \frac{right + left}{right - left}$$

$$B = \frac{top + bottom}{top - bottom}$$

$$C = \frac{far + near}{far - near}$$

$$D = \frac{2\,far\,near}{far - near}$$

The current matrix is multiplied by this matrix with the result replacing the current matrix. That is, if *M* is the current matrix and *F* is the frustum perspective matrix, then *M* is replaced with *M**F*.

Use **glPushMatrix** and **glPopMatrix** to save and restore the current matrix stack.

NOTES

Depth buffer precision is affected by the values specified for *near* and *far*. The greater the ratio of *far* to *near* is, the less effective the depth buffer will be at distinguishing between surfaces that are near each other. If

$$r = \frac{far}{near}$$

roughly ld(r) bits of depth buffer precision are lost. Because r approaches infinity as *near* approaches zero, *near* must never be set to zero.

ERRORS

GL_INVALID_VALUE is generated if either *near* or *far* is not positive.

GL_INVALID_OPERATION is generated if **glFrustum** is called between a call to **glBegin** and the corresponding call to **glEnd**.

glGetClipPlane

NAME

glGetClipPlane -- return the coefficients of the specified clipping plane

C SPECIFICATION

```
void glGetClipPlane(GLenum plane,
                    GLdouble *equation)
```

PARAMETERS

plane
: Specifies a clipping plane. The number of clipping planes depends on the implementation, but at least six clipping planes are supported. They are identified by symbolic names of the form **GL_CLIP_PLANE***i* where 0 <= *i* < **GL_MAX_CLIP_PLANES**.

equation
: Returns four double-precision values that are the coefficients of the plane equation of *plane* in eye coordinates.

DESCRIPTION

glGetClipPlane returns in *equation* the four coefficients of the plane equation for *plane*.

NOTES

It is always the case that **GL_CLIP_PLANE***i* = **GL_CLIP_PLANE0** + *i*.

If an error is generated, no change is made to the contents of *equation*.

ERRORS

GL_INVALID_ENUM is generated if *plane* is not an accepted value.

GL_INVALID_OPERATION is generated if **glGetClipPlane** is called between a call to **glBegin** and the corresponding call to **glEnd**.

SEE ALSO

glClipPlane

glGet

NAME

glGetBooleanv, **glGetDoublev**, **glGetFloatv**, **glGetIntegerv** -- return the value or values of a selected parameter

C SPECIFICATION

```
glGetBooleanv(GLenum pname,
              GLboolean *params)
glGetDoublev(GLenum pname,
             GLdouble *params)
glGetFloatv(GLenum pname,
            GLfloat *params)
glGetIntegerv(GLenum pname,
              GLint *params)
```

PARAMETERS

pname
Specifies the parameter value to be returned. The symbolic constants in the list below are accepted.

params
Returns the value or values of the specified parameter.

DESCRIPTION

These four commands return values for simple state variables in GL. *pname* is a symbolic constant indicating the state variable to be returned, and *params* is a pointer to an array of the indicated type in which to place the returned data.

Type conversion is performed if *params* has a different type than the state variable value being requested. If **glGetBooleanv** is called, a floating-point or integer value is converted to **GL_FALSE** if and only if it is zero. Otherwise, it is converted to **GL_TRUE**. If **glGetIntegerv** is called, Boolean values are returned as **GL_TRUE** or **GL_FALSE**, and most floating-point values are rounded to the nearest integer value. Floating-point colors and normals, however, are returned with a linear mapping that maps 1.0 to the most positive representable integer value, and -1.0 to the most negative representable integer value. If **glGetFloatv** or **glGetDoublev** is called, Boolean values are returned as **GL_TRUE** or **GL_FALSE**, and integer values are converted to floating-point values.

The following symbolic constants are accepted by *pname*:

GL_ACCUM_ALPHA_BITS
params returns one value, the number of alpha bitplanes in the accumulation buffer.

GL_ACCUM_BLUE_BIT
params returns one value, the number of blue bitplanes in the accumulation buffer.

GL_ACCUM_CLEAR_VALUE
params returns four values: the red, greeen, blue, and alpha values used to clear the accumulation buffer. Integer values, if requested, are linearly mapped from the internal floating-point representation such that 1.0 returns the most positive representable integer value, and -1.0 returns the most negative representable integer value. See **glClearAccum**.

GL_ACCUM_GREEN_BITS
params returns one value, the number of green bitplanes in the accumulation buffer.

GL_ACCUM_RED_BITS
params returns one value, the number of red bitplanes in the accumulation buffer.

GL_ALPHA_BIAS
params returns one value, the alpha bias factor used during pixel transfers. See **glPixelTransfer**.

GL_ALPHA_BITS
params returns one value, the number of alpha bitplanes in each color buffer.

GL_ALPHA_SCALE
params returns one value, the alpha scale factor used during pixel transfers. See **glPixelTransfer**.

GL_ALPHA_TEST
params returns a single Boolean value indicating whether alpha testing of fragments is enabled. See **glAlphaFunc**.

GL_ALPHA_TEST_FUNC
params returns one value, the symbolic name of the alpha test function. See **glAlphaFunc**.

GL_ALPHA_TEST_REF
params returns one value, the reference value for the alpha test. See **glAlphaFunc**. An integer value, if requested, is linearly mapped from the internal floating-point representation such that 1.0 returns the most positive representable integer value, and -1.0 returns the most negative representable integer value.

GL_ATTRIB_STACK_DEPTH
params returns one value, the depth of the attribute stack. If the stack is empty, zero is returned. See **glPushAttrib**.

GL_AUTO_NORMAL
params returns a single Boolean value indicating whether 2-D map evaluation automatically generates surface normals. See **glMap2**.

GL_AUX_BUFFERS
params returns one value, the number of auxiliary color buffers.

GL_BLEND
params returns a single Boolean value indicating whether blending is enabled. See **glBlendFunc**.

GL_BLEND_DST
params returns one value, the symbolic constant identifying the destination blend function. See **glBlendFunc**.

GL_BLEND_SRC
params returns one value, the symbolic constant identifying the source blend function. See **glBlendFunc**.

GL_BLUE_BIAS
params returns one value, the blue bias factor used during pixel transfers. See **glPixelTransfer**.

GL_BLUE_BITS
params returns one value, the number of blue bitplanes in each color buffer.

GL_BLUE_SCALE
params returns one value, the blue scale factor used during pixel transfers. See **glPixelTransfer**.

GL_CLIP_PLANE*i*
params returns a single Boolean value indicating whether the specified clipping plane is enabled. See

glClipPlane.

GL_COLOR_CLEAR_VALUE
params returns four values: the red, green, blue, and alpha values used to clear the color buffers. Integer values, if requested, are linearly mapped from the internal floating-point representation such that 1.0 returns the most positive representable integer value, and -1.0 returns the most negative representable integer value. See **glClearColor**.

GL_COLOR_MATERIAL
params returns a single Boolean value indicating whether one or more material parameters are tracking the current color. See **glColorMaterial**.

GL_COLOR_MATERIAL_FACE
params returns one value, a symbolic constant indicating which materials have a parameter that is tracking the current color. See **glColorMaterial**.

GL_COLOR_MATERIAL_PARAMETER
params returns one value, a symbolic constant indicating which material parameters are tracking the current color. See **glColorMaterial**.

GL_COLOR_WRITEMASK
params returns four Boolean values: the red, green, blue, and alpha write enables for the color buffers. See **glColorMask**.

GL_CULL_FACE
params returns a single Boolean value indicating whether polygon culling is enabled. See **glCullFace**.

GL_CULL_FACE_MODE
params returns one value, a symbolic constant indicating which polygon faces are to be culled. See **glCullFace**.

GL_CURRENT_COLOR
params returns four values: the red, green, blue, and alpha values of the current color. Integer values, if requested, are linearly mapped from the internal floating-point representation such that 1.0 returns the most positive representable integer value, and -1.0 returns the most negative representable integer value. See **glColor**.

GL_CURRENT_INDEX
params returns one value, the current color index. See **glIndex**.

GL_CURRENT_NORMAL
params returns three values: the *x*, *y*, and *z* values of the current normal. Integer values, if requested, are linearly mapped from the internal floating-point representation such that 1.0 returns the most positive representable integer value, and -1.0 returns the most negative representable integer value. See **glNormal**.

GL_CURRENT_RASTER_COLOR
params returns four values: the red, green, blue, and alpha values of the current raster position. Integer values, if requested, are linearly mapped from the internal floating-point representation such that 1.0 returns the most positive representable integer value, and -1.0 returns the most negative representable integer value. See **glRasterPos**.

GL_CURRENT_RASTER_INDEX
params returns one value, the color index of the current raster position. See **glRasterPos**.

GL_CURRENT_RASTER_POSITION
params returns four values: the *x*, *y*, *z*, and *w* components of the current raster position. *x*, *y*, and *z* are in window coordinates, and *w* is in clip coordinates. See **glRasterPos**.

GL_CURRENT_RASTER_TEXTURE_COORDS

params returns four values: the *s*, *t*, *r*, and *q* current raster texture coordinates. See **glRasterPos** and **glTexCoord**.

GL_CURRENT_RASTER_POSITION_VALID

params returns a single Boolean value indicating whether the current raster position is valid. See **glRasterPos**.

GL_CURRENT_TEXTURE_COORDS

params returns four values: the *s*, *t*, *r*, and *q* current texture coordinates. See **glTexCoord**.

GL_DEPTH_BITS

params returns one value, the number of bitplanes in the depth buffer.

GL_DEPTH_CLEAR_VALUE

params returns one value, the value that is used to clear the depth buffer. Integer values, if requested, are linearly mapped from the internal floating-point representation such that 1.0 returns the most positive representable integer value, and -1.0 returns the most negative representable integer value. See **glClearDepth**.

GL_DEPTH_FUNC

params returns one value, the symbolic constant that indicates the depth comparison function. See **glDepthFunc**.

GL_DEPTH_RANGE

params returns two values: the near and far mapping limits for the depth buffer. Integer values, if requested, are linearly mapped from the internal floating-point representation such that 1.0 returns the most positive representable integer value, and -1.0 returns the most negative representable integer value. See **glDepthRange**.

GL_DEPTH_WRITEMASK

params returns a single Boolean value indicating if the depth buffer is enabled for writing. See **glDepthMask**.

GL_DOUBLEBUFFER

params returns a single Boolean value indicating whether double buffering is supported.

GL_DRAW_BUFFER

params returns one value, a symbolic constant indicating which buffers are being drawn to. See **glDrawBuffer**.

GL_EDGE_FLAG

params returns a single Boolean value indication whether the current edge flag is true or false. See **glEdgeFlag**.

GL_FOG

params returns a single Boolean value indicating whether fogging is enabled. See **glFog**.

GL_FOG_COLOR

params returns four values: the red, green, blue, and alpha components of the fog color. Integer values, if requested, are linearly mapped from the internal floating-point representation such that 1.0 returns the most positive representable integer value, and -1.0 returns the most negative representable integer value. See **glFog**.

GL_FOG_DENSITY

params returns one value, the fog density parameter. See **glFog**.

GL_FOG_END

params returns one value, the end factor for the linear fog equation. See **glFog**.

GL_FOG_HINT

params returns one value, a symbolic constant indicating the mode of the fog hint. See **glHint**.

GL_FOG_INDEX
params returns one value, the fog color index. See **glFog**.

GL_FOG_MODE
params returns one value, a symbolic constant indicating which fog equation is selected. See **glFog**.

GL_FOG_START
params returns one value, the start factor for the linear fog equation. See **glFog**.

GL_FRONT_FACE
params returns one value, a symbolic constant indicating whether clockwise or counterclockwise polygon winding is treated as front-facing. See **glFrontFace**.

GL_GREEN_BIAS
params returns one value, the green bias factor used during pixel transfers.

GL_GREEN_BITS
params returns one value, the number of green bitplanes in each color buffer.

GL_GREEN_SCALE
params returns one value, the green scale factor used during pixel transfers. See **glPixelTransfer**.

GL_INDEX_BITS
params returns one value, the number of bitplanes in each color index buffer.

GL_INDEX_CLEAR_VALUE
params returns one value, the color index used to clear the color index buffers. See **glClearIndex**.

GL_INDEX_MODE
params returns a single Boolean value indicating whether the GL is in color index mode (true) or RGBA mode (false).

GL_INDEX_OFFSET
params returns one value, the offset added to color and stencil indices during pixel transfers. See **glPixelTransfer**.

GL_INDEX_SHIFT
params returns one value, the amount that color and stencil indices are shifted during pixel transfers. See **glPixelTransfer**.

GL_INDEX_WRITEMASK
params returns one value, a mask indicating which bitplanes of each color index buffer can be written. See **glIndexMask**.

GL_LIGHT*i*
params returns a single Boolean value indicating whether the specified light is enabled. See **glLight** and **glLightModel**.

GL_LIGHTING
params returns a single Boolean value indicating whether lighting is enabled. See **glLightModel**.

GL_LIGHT_MODEL_AMBIENT
params returns four values: the red, green, blue, and alpha components of the ambient intensity of the entire scene. Integer values, if requested, are linearly mapped from the internal floating-point representation such that 1.0 returns the most positive representable integer value, and -1.0 returns the most negative representable integer

value. See **glLightModel**.

GL_LIGHT_MODEL_LOCAL_VIEWER
params returns a single Boolean value indicating whether specular reflection calculations treat the viewer as being local to the scene. See **glLightModel**.

GL_LIGHT_MODEL_TWO_SIDE
params returns a single Boolean value indicating whether separate materials are used to compute lighting for front- and back-facing polygons. See **glLightModel**.

GL_LINE_SMOOTH
params returns a single Boolean value indicating whether antialiasing of lines is enabled. See **glLineWidth**.

GL_LINE_STIPPLE
params returns a single Boolean value indicating whether stippling of lines is enabled. See **glLineStipple**.

GL_LINE_STIPPLE_PATTERN
params returns one value, the 16-bit line stipple pattern. See **glLineStipple**.

GL_LINE_STIPPLE_REPEAT
params returns one value, the line stipple repeat factor. See **glLineStipple**.

GL_LINE_WIDTH
params returns one value, the line width as specified with **glLineWidth**.

GL_LINE_WIDTH_GRANULARITY
params returns one value, the width difference between adjacent supported widths for antialiased lines. See **glLineWidth**.

GL_LINE_WIDTH_RANGE
params returns two values: the smallest and largest supported widths for antialiased lines. See **glLineWidth**.

GL_LIST_BASE
params returns one value, the base offset added to all names in arrays presented to **glCallLists**. See **glListBase**.

GL_LIST_INDEX
params returns one value, the name of the display list currently under construction. Zero is returned if no display list is currently under construction. See **glNewList**.

GL_LIST_MODE
params returns one value, a symbolic constant indicating the construction mode of the display list currently being constructed. See **glNewList**.

GL_LOGIC_OP
params returns a single Boolean value indicating whether fragment indexes are merged into the framebuffer using a logical operation. See **glLogicOp**.

GL_LOGIC_OP_MODE
params returns one value, a symbolic constant indicating the selected logic operational mode. See **glLogicOp**.

GL_MAP1_COLOR_4
params returns a single Boolean value indicating whether 1D evaluation generates colors. See **glMap1**.

GL_MAP1_GRID_DOMAIN
params returns two values: the endpoints of the 1-D map's grid domain. See **glMapGrid**.

GL_MAP1_GRID_SEGMENTS
params returns one value, the number of partitions in the 1-D map's grid domain. See **glMapGrid**.

GL_MAP1_INDEX
params returns a single Boolean value indicating whether 1D evaluation generates color indices. See **glMap1**.

GL_MAP1_NORMAL
params returns a single Boolean value indicating whether 1D evaluation generates normals. See **glMap1**.

GL_MAP1_TEXTURE_COORD_1
params returns a single Boolean value indicating whether 1D evaluation generates 1D texture coordinates. See **glMap1**.

GL_MAP1_TEXTURE_COORD_2
params returns a single Boolean value indicating whether 1D evaluation generates 2D texture coordinates. See **glMap1**.

GL_MAP1_TEXTURE_COORD_3
params returns a single Boolean value indicating whether 1D evaluation generates 3D texture coordinates. See **glMap1**.

GL_MAP1_TEXTURE_COORD_4
params returns a single Boolean value indicating whether 1D evaluation generates 4D texture coordinates. See **glMap1**.

GL_MAP1_VERTEX_3
params returns a single Boolean value indicating whether 1D evaluation generates 3D vertex coordinates. See **glMap1**.

GL_MAP1_VERTEX_4
params returns a single Boolean value indicating whether 1D evaluation generates 4D vertex coordinates. See **glMap1**.

GL_MAP2_COLOR_4
params returns a single Boolean value indicating whether 2D evaluation generates colors. See **glMap2**.

GL_MAP2_GRID_DOMAIN
params returns four values: the endpoints of the 2-D map's *i* and *j* grid domains. See **glMapGrid**.

GL_MAP2_GRID_SEGMENTS
params returns two values: the number of partitions in the 2-D map's *i* and *j* grid domains. See **glMapGrid**.

GL_MAP2_INDEX
params returns a single Boolean value indicating whether 2D evaluation generates color indices. See **glMap2**.

GL_MAP2_NORMAL
params returns a single Boolean value indicating whether 2D evaluation generates normals. See **glMap2**.

GL_MAP2_TEXTURE_COORD_1
params returns a single Boolean value indicating whether 2D evaluation generates 1D texture coordinates. See **glMap2**.

GL_MAP2_TEXTURE_COORD_2
params returns a single Boolean value indicating whether 2D evaluation generates 2D texture coordinates. See **glMap2**.

GL_MAP2_TEXTURE_COORD_3
params returns a single Boolean value indicating whether 2D evaluation generates 3D texture coordinates. See **glMap2**.

GL_MAP2_TEXTURE_COORD_4
params returns a single Boolean value indicating whether 2D evaluation generates 4D texture coordinates. See **glMap2**.

GL_MAP2_VERTEX_3
params returns a single Boolean value indicating whether 2D evaluation generates 3D vertex coordinates. See **glMap2**.

GL_MAP2_VERTEX_4
params returns a single Boolean value indicating whether 2D evaluation generates 4D vertex coordinates. See **glMap2**.

GL_MAP_COLOR
params returns a single Boolean value indicating if colors and color indices are to be replaced by table lookup during pixel transfers. See **glPixelTransfer**.

GL_MAP_STENCIL
params returns a single Boolean value indicating if stencil indices are to be replaced by table lookup during pixel transfers. See **glPixelTransfer**.

GL_MATRIX_MODE
params returns one value, a symbolic constant indicating which matrix stack is currently the target of all matrix operations. See **glMatrixMode**.

GL_MAX_ATTRIB_STACK_DEPTH
params returns one value, the maximum supported depth of the attribute stack. See **glPushAttrib**.

GL_MAX_CLIP_PLANES
params returns one value, the maximum number of application-defined clipping planes. See **glClipPlane**.

GL_MAX_EVAL_ORDER
params returns one value, the maximum equation order supported by 1-D and 2-D evaluators. See **glMap1** and **glMap2**.

GL_MAX_LIGHTS
params returns one value, the maximum number of lights. See **glLight**.

GL_MAX_LIST_NESTING
params returns one value, the maximum recursion depth allowed during display-list traversal. See **glCallList**.

GL_MAX_MODELVIEW_STACK_DEPTH
params returns one value, the maximum supported depth of the modelview matrix stack. See **glPushMatrix**.

GL_MAX_NAME_STACK_DEPTH
params returns one value, the maximum supported depth of the selection name stack. See **glPushName**.

GL_MAX_PIXEL_MAP_TABLE
params returns one value, the maximum supported size of a **glPixelMap** lookup table. See **glPixelMap**.

GL_MAX_PROJECTION_STACK_DEPTH
params returns one value, the maximum supported depth of the projection matrix stack. See **glPushMatrix**.

GL_MAX_TEXTURE_SIZE
params returns one value, the maximum width or height of any texture image (without borders). See **glTexImage1D** and **glTexImage2D**.

GL_MAX_TEXTURE_STACK_DEPTH
params returns one value, the maximum supported depth of the texture matrix stack. See **glPushMatrix**.

GL_MAX_VIEWPORT_DIMS
params returns two values: the maximum supported width and height of the viewport. See **glViewport**.

GL_MODELVIEW_MATRIX
params returns sixteen values: the modelview matrix on the top of the modelview matrix stack. See **glPushMatrix**.

GL_MODELVIEW_STACK_DEPTH
params returns one value, the number of matrices on the modelview matrix stack. See **glPushMatrix**.

GL_NAME_STACK_DEPTH
params returns one value, the number of names on the selection name stack. See **glPushMatrix**.

GL_NORMALIZE
params returns a single Boolean value indicating whether normals are automatically scaled to unit length after they have been transformed to eye coordinates. See **glNormal**.

GL_PACK_ALIGNMENT
params returns one value, the byte alignment used for writing pixel data to memory. See **glPixelStore**.

GL_PACK_LSB_FIRST
params returns a single Boolean value indicating whether single-bit pixels being written to memory are written first to the least significant bit of each unsigned byte. See **glPixelStore**.

GL_PACK_ROW_LENGTH
params returns one value, the row length used for writing pixel data to memory. See **glPixelStore**.

GL_PACK_SKIP_PIXELS
params returns one value, the number of pixel locations skipped before the first pixel is written into memory. See **glPixelStore**.

GL_PACK_SKIP_ROWS
params returns one value, the number of rows of pixel locations skipped before the first pixel is written into memory. See **glPixelStore**.

GL_PACK_SWAP_BYTES
params returns a single Boolean value indicating whether the bytes of two-byte and four-byte pixel indices and components are swapped before being written to memory. See **glPixelStore**.

GL_PIXEL_MAP_A_TO_A_SIZE
params returns one value the size of the alpha-to-alpha pixel translation table. See **glPixelMap**.

GL_PIXEL_MAP_B_TO_B_SIZE
params returns one value, the size of the blue-to-blue pixel translation table. See **glPixelMap**.

GL_PIXEL_MAP_G_TO_G_SIZE
params returns one value, the size of the green-to-green pixel translation table. See **glPixelMap**.

GL_PIXEL_MAP_I_TO_A_SIZE
params returns one value, the size of the index-to-alpha pixel translation table. See **glPixelMap**.

GL_PIXEL_MAP_I_TO_B_SIZE
params returns one value, the size of the index-to-blue pixel translation table. See **glPixelMap**.

GL_PIXEL_MAP_I_TO_G_SIZE
params returns one value, the size of the index-to-green pixel translation table. See **glPixelMap**.

GL_PIXEL_MAP_I_TO_I_SIZE
params returns one value, the size of the index-to-index pixel translation table. See **glPixelMap**.

GL_PIXEL_MAP_I_TO_R_SIZE
params returns one value, the size of the index-to-red pixel translation table. See **glPixelMap**.

GL_PIXEL_MAP_R_TO_R_SIZE
params returns one value, the size of the red-to-red pixel translation table. See **glPixelMap**.

GL_PIXEL_MAP_S_TO_S_SIZE
params returns one value, the size of the stencil-to-stencil pixel translation table. See **glPixelMap**.

GL_POINT_SIZE
params returns one value, the point size as specified by **glPointSize**.

GL_POINT_SIZE_GRANULARITY
params returns one value, the size difference between adjacent supported sizes for antialiased points. See **glPointSize**.

GL_POINT_SIZE_RANGE
params returns two values: the smallest and largest supported sizes for antialiased points. See **glPointSize**.

GL_POINT_SMOOTH
params returns a single Boolean value indicating whether antialiasing of points is enabled. See **glPointSize**.

GL_POLYGON_MODE
params returns two values: symbolic constants indicating whether front-facing and back-facing polygons are rasterized as points, lines, or filled polygons. See **glPolygonMode**.

GL_POLYGON_SMOOTH
params returns a single Boolean value indicating whether antialiasing of polygons is enabled. See **glPolygonMode**.

GL_POLYGON_STIPPLE
params returns a single Boolean value indicating whether stippling of polygons is enabled. See **glPolygonStipple**.

GL_PROJECTION_MATRIX
params returns sixteen values: the projection matrix on the top of the projection matrix stack. See **glPushMatrix**.

GL_PROJECTION_STACK_DEPTH
params returns one value, the number of matrices on the projection matrix stack. See **glPushMatrix**.

GL_READ_BUFFER
params returns one value, a symbolic constant indicating which color buffer is selected for reading. See

glReadPixels and **glAccum**.

GL_RED_BIAS
params returns one value, the red bias factor used during pixel transfers.

GL_RED_BITS
params returns one value, the number of red bitplanes in each color buffer.

GL_RED_SCALE
params returns one value, the red scale factor used during pixel transfers. See **glPixelTransfer**.

GL_RENDER_MODE
params returns one value, a symbolic constant indicating whether the GL is in render, select, or feedback mode. See **glRenderMode**.

GL_RGBA_MODE
params returns a single Boolean value indicating whether the GL is in RGBA mode (true) or color index mode (false). See **glColor**.

GL_SCISSOR_BOX
params returns four values: the x and y window coordinates of the scissor box, follow by its width and height. See **glScissor**.

GL_SCISSOR_TEST
params returns a single Boolean value indicating whether scissoring is enabled. See **glScissor**.

GL_SHADE_MODEL
params returns one value, a symbolic constant indicating whether the shading mode is flat or smooth. See **glShadeModel**.

GL_STENCIL_BITS
params returns one value, the number of bitplanes in the stencil buffer.

GL_STENCIL_CLEAR_VALUE
params returns one value, the index to which the stencil bitplanes are cleared. See **glClearStencil**.

GL_STENCIL_FAIL
params returns one value, a symbolic constant indicating what action is taken when the stencil test fails. See **glStencilOp**.

GL_STENCIL_FUNC
params returns one value, a symbolic constant indicating what function is used to compare the stencil reference value with the stencil buffer value. See **glStencilFunc**.

GL_STENCIL_PASS_DEPTH_FAIL
params returns one value, a symbolic constant indicating what action is taken when the stencil test passes, but the depth test fails. See **glStencilOp**.

GL_STENCIL_PASS_DEPTH_PASS
params returns one value, a symbolic constant indicating what action is taken when the stencil test passes and the depth test passes. See **glStencilOp**.

GL_STENCIL_REF
params returns one value, the reference value that is compared with the contents of the stencil buffer. See **glStencilFunc**.

GL_STENCIL_TEST
: *params* returns a single Boolean value indicating whether stencil testing of fragments is enabled. See **glStencilFunc** and **glStencilOp**.

GL_STENCIL_VALUE_MASK
: *params* returns one value, the mask that is used to mask both the stencil reference value and the stencil buffer value before they are compared. See **glStencilFunc**.

GL_STENCIL_WRITEMASK
: *params* returns one value, the mask that controls writing of the stencil bitplanes. See **glStencilMask**.

GL_STEREO
: *params* returns a single Boolean value indicating whether stereo buffers (left and right) are supported.

GL_SUBPIXEL_BITS
: *params* returns one value, an estimate of the number of bits of subpixel resolution that are used to position rasterized geometry in window coordinates.

GL_TEXTURE_1D
: *params* returns a single Boolean value indicating whether 1D texture mapping is enabled. See **glTexImage1D**.

GL_TEXTURE_2D
: *params* returns a single Boolean value indicating whether 2D texture mapping is enabled. See **glTexImage2D**.

GL_TEXTURE_GEN_S
: *params* returns a single Boolean value indicating whether automatic generation of the *S* texture coordinate is enabled. See **glTexGen**.

GL_TEXTURE_GEN_T
: *params* returns a single Boolean value indicating whether automatic generation of the *T* texture coordinate is enabled. See **glTexGen**.

GL_TEXTURE_GEN_R
: *params* returns a single Boolean value indicating whether automatic generation of the *R* texture coordinate is enabled. See **glTexGen**.

GL_TEXTURE_GEN_Q
: *params* returns a single Boolean value indicating whether automatic generation of the *Q* texture coordinate is enabled. See **glTexGen**.

GL_TEXTURE_MATRIX
: *params* returns sixteen values: the texture matrix on the top of the texture matrix stack. See **glPushMatrix**.

GL_TEXTURE_STACK_DEPTH
: *params* returns one value, the number of matrices on the texture matrix stack. See **glPushMatrix**.

GL_UNPACK_ALIGNMENT
: *params* returns one value, the byte alignment used for reading pixel data from memory. See **glPixelStore**.

GL_UNPACK_LSB_FIRST
: *params* returns a single Boolean value indicating whether single-bit pixels being read from memory are read first from the least significant bit of each unsigned byte. See **glPixelStore**.

GL_UNPACK_ROW_LENGTH
: *params* returns one value, the row length used for reading pixel data from memory. See **glPixelStore**.

GL_UNPACK_SKIP_IMAGES
params returns one value, the number of images skipped before the first (3D) pixel is read from memory. See **glPixelStore**.

GL_UNPACK_SKIP_PIXELS
params returns one value, the number of pixel locations skipped before the first pixel is read from memory. See **glPixelStore**.

GL_UNPACK_SKIP_ROWS
params returns one value, the number of rows of pixel locations skipped before the first pixel is read from memory. See **glPixelStore**.

GL_UNPACK_SWAP_BYTES
params returns a single Boolean value indicating whether the bytes of two-byte and four-byte pixel indices and components are swapped after being read from memory. See **glPixelStore**.

GL_VIEWPORT
params returns four values: the x and y window coordinates of the viewport, follow by its width and height. See **glViewport**.

GL_ZOOM_X
params returns one value, the x pixel zoom factor. See **glPixelZoom**.

GL_ZOOM_Y
params returns one value, the y pixel zoom factor. See **glPixelZoom**.

Many of the Boolean parameters can also be queried more easily using **glIsEnabled**.

ERRORS

GL_INVALID_ENUM is generated if *pname* is not an accepted value.

GL_INVALID_OPERATION is generated if **glGet** is called between a call to **glBegin** and the corresponding call to **glEnd**.

glGetLight

NAME

glGetLightfv, **glGetLightiv** -- return light source parameter values

C SPECIFICATION

```
voidglGetLightfv(GLenum light,
                 GLenum pname,
                 GLfloat *params)
voidglGetLightiv(GLenum light,
                 GLenum pname,
                 GLint *params)
```

PARAMETERS

light
: Specifies a light source. The number of possible lights depends on the implementation, but at least eight lights are supported. They are identified by symbolic names of the form **GL_LIGHT***i* where 0 <= *i* < **GL_MAX_LIGHTS**.

pname
: Specifies a light source parameter for light. Accepted symbolic names are **GL_AMBIENT**, **GL_DIFFUSE**, **GL_SPECULAR**, **GL_POSITION**, **GL_SPOT_DIRECTION**, **GL_SPOT_EXPONENT**, **GL_SPOT_CUTOFF**, **GL_CONSTANT_ATTENUATION**, **GL_LINEAR_ATTENUATION**, and **GL_QUADRATIC_ATTENUATION**.

params
: Returns the requested data.

DESCRIPTION

glGetLight returns in *params* the value or values of a light source parameter. *light* names the light and is a symbolic name of the form **GL_LIGHT***i* for 0 <= *i* < **GL_MAX_LIGHTS**, where **GL_MAX_LIGHTS** is an implementation dependent constant that is greater than or equal to eight. *pname* specifies one of ten light source parameters, again by symbolic name.

The parameters are as follows:

GL_AMBIENT
: *params* returns four integer or floating-point values representing the ambient intensity of the light source. Integer values, when requested, are linearly mapped from the internal floating-point representation such that 1.0 maps to the most positive representable integer value, and -1.0 maps to the most negative representable integer value. If the internal value is outside the range [-1, 1], the corresponding integer return value is undefined.

GL_DIFFUSE
: *params* returns four integer or floating-point values representing the diffuse intensity of the light source. Integer values, when requested, are linearly mapped from the internal floating-point representation such that 1.0 maps to the most positive representable integer value, and -1.0 maps to the most negative representable integer value. If the internal value is outside the range [-1, 1], the corresponding integer return value is undefined.

GL_SPECULAR

params returns four integer or floating-point values representing the specular intensity of the light source. Integer values, when requested, are linearly mapped from the internal floating-point representation such that 1.0 maps to the most positive representable integer value, and -1.0 maps to the most negative representable integer value. If the internal value is outside the range [-1, 1], the corresponding integer return value is undefined.

GL_POSITION

params returns four integer or floating-point values representing the position of the light source. Integer values, when requested, are computed by rounding the internal floating-point values to the nearest integer value. The returned values are those maintained in eye coordinates. They will not be equal to the values specified using **glLight**, unless the modelview matrix was identity at the time **glLight** was called.

GL_SPOT_DIRECTION

params returns three integer or floating-point values representing the direction of the light source. Integer values, when requested, are computed by rounding the internal floating-point values to the nearest integer value. The returned values are those maintained in eye coordinates. They will not be equal to the values specified using **glLight**, unless the modelview matrix was identity at the time **glLight** was called. Although spot direction is normalized before being used in the lighting equation, the returned values are the transformed versions of the specified values prior to normalization.

GL_SPOT_EXPONENT

params returns a single integer or floating-point value representing the spot exponent of the light. An integer value, when requested, is computed by rounding the internal floating-point representation to the nearest integer.

GL_SPOT_CUTOFF

params returns a single integer or floating-point value representing the spot cutoff angle of the light. An integer value, when requested, is computed by rounding the internal floating-point representation to the nearest integer.

GL_CONSTANT_ATTENUATION

params returns a single integer or floating-point value representing the constant (not distance related) attenuation of the light. An integer value, when requested, is computed by rounding the internal floating-point representation to the nearest integer.

GL_LINEAR_ATTENUATION

params returns a single integer or floating-point value representing the linear attenuation of the light. An integer value, when requested, is computed by rounding the internal floating-point representation to the nearest integer.

GL_QUADRATIC_ATTENUATION

params returns a single integer or floating-point value representing the quadratic attenuation of the light. An integer value, when requested, is computed by rounding the internal floating-point representation to the nearest integer.

NOTES

It is always the case that **GL_LIGHT***i* = **GL_LIGHT0** + *i*.

If an error is generated, no change is made to the contents of *params*.

ERRORS

GL_INVALID_ENUM is generated if *light* or *pname* is not an accepted value.

GL_INVALID_OPERATION is generated if **glGetLight** is called between a call to **glBegin** and the corresponding call to **glEnd**.

SEE ALSO

glLight

---

glGetError

NAME

glGetError -- return error information

C SPECIFICATION

```
GLenum glGetError(void void)
```

DESCRIPTION

glGetError returns the value of the error flag. Each detectable error is assigned a numeric code and symbolic name. When an error occurs, the error flag is set to the appropriate error code value. No other errors are recorded until **glGetError** is called, the error code is returned, and the flag is reset to **GL_NO_ERROR**. If a call to **glGetError** returns **GL_NO_ERROR**, there has been no detectable error since the last call to **glGetError**, or since the GL was initialized.

To allow for distributed implementations, there may be several error flags. If any single error flag has recorded an error, the value of that flag is returned and that flag is reset to **GL_NO_ERROR** when **glGetError** is called. If more than one flag has recorded an error, **glGetError** returns and clears an arbitrary error flag value. Thus, **glGetError** should always be called in a loop, until it returns **GL_NO_ERROR**, if all error flags are to be reset.

Initially, all error flags are set to **GL_NO_ERROR**.

The currently defined errors are as follows:

GL_NO_ERROR
: No error has been recorded. The value of this symbolic constant is guaranteed to be zero.

GL_INVALID_ENUM
: An unacceptable value is specified for an enumerated argument. The offending command is ignored, having no side effect other than to set the error flag.

GL_INVALID_VALUE
: A numeric argument is out of range. The offending command is ignored, having no side effect other than to set the error flag.

GL_INVALID_OPERATION
: The specified operation is not allowed in the current state. The offending command is ignored, having no side effect other than to set the error flag.

GL_STACK_OVERFLOW
: This command would cause a stack overflow. The offending command is ignored, having no side effect other than to set the error flag.

GL_STACK_UNDERFLOW
: This command would cause a stack underflow. The offending command is ignored, having no side effect other than to set the error flag.

GL_OUT_OF_MEMORY
: There is not enough memory left to execute the command. The state of the GL is undefined, except for the state

of the error flags, after this error is recorded.

When an error flag is set, results of a GL operation are undefined only if **GL_OUT_OF_MEMORY** has occurred. In all other cases, the command generating the error is ignored and has no effect on the GL state or frame buffer contents.

ERRORS

GL_INVALID_OPERATION is generated if **glGetError** is called between a call to **glBegin** and the corresponding call to **glEnd**.

---

glGetMaterial

NAME

glGetMaterialfv, **glGetMaterialiv** -- return material parameters

C SPECIFICATION

```
void glGetMaterialfv(GLenum face,
                     GLenum pname,
                     GLfloat *params)
void glGetMaterialiv(GLenum face,
                     GLenum pname,
                     GLint *params)
```

PARAMETERS

face
: Specifies which of the two materials is being queried. **GL_FRONT** or **GL_BACK** are accepted, representing the front and back materials, respectively.

pname
: Specifies the material parameter to return. **GL_AMBIENT**, **GL_DIFFUSE**, **GL_SPECULAR**, **GL_EMISSION**, **GL_SHININESS**, and **GL_COLOR_INDEXES** are accepted.

params
: Returns the requested data.

DESCRIPTION

glGetMaterial returns in *params* the value or values of parameter *pname* of material *face*. Six parameters are defined:

GL_AMBIENT
: *params* returns four integer or floating-point values representing the ambient reflectance of the material. Integer values, when requested, are linearly mapped from the internal floating-point representation such that 1.0 maps to the most positive representable integer value, and -1.0 maps to the most negative representable integer value. If the internal value is outside the range [-1, 1], the corresponding integer return value is undefined.

GL_DIFFUSE
: *params* returns four integer or floating-point values representing the diffuse reflectance of the material. Integer values, when requested, are linearly mapped from the internal floating-point representation such that 1.0 maps to the most positive representable integer value, and -1.0 maps to the most negative representable integer value. If the internal value is outside the range [-1, 1], the corresponding integer return value is undefined.

GL_SPECULAR
: *params* returns four integer or floating-point values representing the specular reflectance of the material. Integer values, when requested, are linearly mapped from the internal floating-point representation such that 1.0 maps to the most positive representable integer value, and -1.0 maps to the most negative representable integer value. If the internal value is outside the range [-1, 1], the corresponding integer return value is undefined.

GL_EMISSION
: *params* returns four integer or floating-point values representing the emitted light intensity of the material. Integer values, when requested, are linearly mapped from the internal floating-point representation such that 1.0

maps to the most positive representable integer value, and -1.0 maps to the most negative representable integer value. If the internal value is outside the range [-1, 1], the corresponding integer return value is undefined.

GL_SHININESS
params returns one integer or floating-point value representing the specular exponent of the material. Integer values, when requested, are computed by rounding the internal floating-point value to the nearest integer value.

GL_COLOR_INDEXES
params returns three integer or floating-point values representing the ambient, diffuse, and specular indices of the material. These indices are used only for color index lighting. (The other parameters are all used only for RGBA lighting.) Integer values, when requested, are computed by rounding the internal floating-point values to the nearest integer values.

NOTES

If an error is generated, no change is made to the contents of *params*.

ERRORS

GL_INVALID_ENUM is generated if *face* or *pname* is not an accepted value.

GL_INVALID_OPERATION is generated if **glGetMaterial** is called between a call to **glBegin** and the corresponding call to **glEnd**.

SEE ALSO

glMaterial

glGetMap

NAME

glGetMapdv, **glGetMapfv**, **glGetMapiv** -- return evaluator parameters

C SPECIFICATION

```
void glGetMapdv(GLenum target,
                GLenum query,
                GLdouble *v)
void glGetMapfv(GLenum target,
                GLenum query,
                GLfloat *v)
void glGetMapiv(GLenum target,
                GLenum query,
                GLint *v)
```

PARAMETERS

target
: Specifies the symbolic name of a map. Accepted values are **GL_MAP1_COLOR_4**, **GL_MAP1_INDEX**, **GL_MAP1_NORMAL**, **GL_MAP1_TEXTURE_COORD_1**, **GL_MAP1_TEXTURE_COORD_2**, **GL_MAP1_TEXTURE_COORD_3**, **GL_MAP1_TEXTURE_COORD_4**, **GL_MAP1_VERTEX_3**, **GL_MAP1_VERTEX_4**, **GL_MAP2_COLOR_4**, **GL_MAP2_INDEX**, **GL_MAP2_NORMAL**, **GL_MAP2_TEXTURE_COORD_1**, **GL_MAP2_TEXTURE_COORD_2**, **GL_MAP2_TEXTURE_COORD_3**, **GL_MAP2_TEXTURE_COORD_4**, **GL_MAP2_VERTEX_3**, and **GL_MAP2_VERTEX_4.**

query
: Specifies which parameter to return. Symbolic names **GL_COEFF**, **GL_ORDER**, and **GL_DOMAIN** are accepted.

v
: Returns the requested data.

DESCRIPTION

glMap1 and **glMap2** define evaluators. **glGetMap** returns evaluator parameters. *target* chooses a map, *query* selects a specific parameter, and *v* points to storage where the values will be returned.

The acceptable values for the *target* parameter are described in the **glMap1** and **glMap2** reference pages.

query can assume the following values:

GL_COEFF
: *v* returns the control points for the evaluator function. One-dimensional evaluators return *order* control points, and two-dimensional evaluators return *uorder***vorder* control points. Each control point consists of one, two, three, or four integer, single-precision floating-point, or double-precision floating-point values, depending on the type of the evaluator. Two-dimensional control points are returned in row-major order, incrementing the *uorder* index quickly, and the *vorder* index after each row. Integer values, when requested, are computed by rounding the internal floating-point values to the nearest integer values.

GL_ORDER

v returns the order of the evaluator function. One-dimensional evaluators return a single value, *order*. Two-dimensional evaluators return two values, *uorder* and *vorder*.

GL_DOMAIN

v returns the linear *u* and *v* mapping parameters. One-dimensional evaluators return two values, *u1* and *u2*, as specified by **glMap1**. Two-dimensional evaluators return four values (*u1*, *u2*, *v1*, and *v2*) as specified by **glMap2**. Integer values, when requested, are computed by rounding the internal floating-point values to the nearest integer values.

NOTES

If an error is generated, no change is made to the contents of *v*.

ERRORS

GL_INVALID_ENUM is generated if *target* or *query* is not an accepted value.

GL_INVALID_OPERATION is generated if **glGetMap** is called between a call to **glBegin** and the corresponding call to **glEnd**.

glGetPolygonStipple

NAME

glGetPolygonStipple -- return the polygon stipple pattern

C SPECIFICATION

```
void glGetPolygonStipple(GLubyte *mask)
```

PARAMETERS

mask
Returns the stipple pattern.

DESCRIPTION

glGetPolygonStipple returns to *mask* a 32x32 polygon stipple pattern. The pattern is packed into memory as if **glReadPixels** with both height and width of 32, type of **GL_BITMAP**, and format of **GL_COLOR_INDEX** were called, and the stipple pattern were stored in an internal 32x32 color index buffer. Unlike **glReadPixels**, however, pixel transfer operations (shift, offset, pixel map) are not applied to the returned stipple image.

NOTES

If an error is generated, no change is made to the contents of *mask*.

ERRORS

GL_INVALID_OPERATION is generated if **glGetPolygonStipple** is called between a call to **glBegin** and the corresponding call to **glEnd**.

glGetPixelMap

NAME

glGetPixelMapfv, **glGetPixelMapuiv**, **glGetPixelMapusv** -- return the specified pixel map

C SPECIFICATION

```
void glGetPixelMapfv(GLenum map,
                     GLfloat *values)
void glGetPixelMapuiv(GLenum map,
                      GLuint *values)
void glGetPixelMapusv(GLenum map,
                      GLushort *values)
```

PARAMETERS

map
Specifies the name of the pixel map to return. Accepted values are **GL_PIXEL_MAP_I_TO_I**, **GL_PIXEL_MAP_S_TO_S**, **GL_PIXEL_MAP_I_TO_R**, **GL_PIXEL_MAP_I_TO_G**, **GL_PIXEL_MAP_I_TO_B**, **GL_PIXEL_MAP_I_TO_A**, **GL_PIXEL_MAP_R_TO_R**, **GL_PIXEL_MAP_G_TO_G**, **GL_PIXEL_MAP_B_TO_B**, and **GL_PIXEL_MAP_A_TO_A**.

values
Returns the pixel map contents.

DESCRIPTION

Please see the **PixelMap** reference page for a description of the acceptable values for the *map* parameter. **glGetPixelMap** returns in *values* the contents of the pixel map specified in *map*. Pixel maps are used during the execution of **glReadPixels**, **glDrawPixels**, **glCopyPixels**, **glTexImage1D** and **glTexImage2D**, to map color indices, stencil indices, color components, and depth components to other values.

Unsigned integer values, if requested, are linearly mapped from the internal fixed or floating-point representation such that 1.0 maps to the largest representable integer value, and 0.0 maps to zero. Return unsigned integer values are undefined if the map value was not in the range [0, 1].

To determine the required size of map, call **glGet** with the appropriate symbolic constant.

NOTES

If an error is generated, no change is made to the contents of *values*.

ERRORS

GL_INVALID_ENUM is generated if *map* is not an accepted value.

GL_INVALID_OPERATION is generated if **glGetPixelMap** is called between a call to **glBegin** and the corresponding call to **glEnd**.

glGetTexEnv

NAME

glGetTexEnvfv, **glGetTexEnviv** -- return texture environment parameters

C SPECIFICATION

```
void glGetTexEnvfv(GLenum target,
                   GLenum pname,
                   GLfloat *params)
void glGetTexEnviv(GLenum target,
                   GLenum pname,
                   GLint *params)
```

PARAMETERS

target
: Specifies a texture environment. Must be **GL_TEXTURE_ENV**.

pname
: Specifies the symbolic name of a texture environment parameter. Accepted values are **GL_TEXTURE_ENV_MODE** and **GL_TEXTURE_ENV_COLOR**.

params
: Returns the requested data.

DESCRIPTION

glGetTexEnv returns in *params* selected values of a texture environment that was specified with **glTexEnv**. *target* specifies a texture environment. Currently, only one texture environment is defined and supported: **GL_TEXTURE_ENV**.

pname names a specific texture environment parameter. The two parameters are as follows:

GL_TEXTURE_ENV_MODE
: *params* returns the single-valued texture environment mode, a symbolic constant.

GL_TEXTURE_ENV_COLOR
: *params* returns four integer or floating-point values that are the texture environment color. Integer values, when requested, are linearly mapped from the internal floating-point representation such that 1.0 maps to the most positive representable integer, and -1.0 maps to the most negative representable integer.

NOTES

If an error is generated, no change is made to the contents of *params*.

ERRORS

GL_INVALID_ENUM is generated if *target* or *pname* is not an accepted value.

GL_INVALID_OPERATION is generated if **glGetTexEnv** is called between a call to **glBegin** and the corresponding call to **glEnd**.

glGetString

NAME

glGetString -- returns a string describing the current GL connection

C SPECIFICATION

```
const GLubyte *glGetString(GLenum name)
```

PARAMETERS

name
: Specifies a symbolic constant, one of **GL_VENDOR**, **GL_RENDERER**, **GL_VERSION**, or **GL_EXTENSIONS**.

DESCRIPTION

glGetString returns a pointer to a static string describing some aspect of the current GL connection. *name* can be one of the following:

GL_VENDOR
: Returns the company responsible for this GL implementation. This name does not change from release to release.

GL_RENDERER
: Returns the name of the renderer. This name is typically specific to a particular configuration of a hardware platform. It does not change from release to release.

GL_VERSION
: Returns a version or release number.

GL_EXTENSIONS
: Returns a space-separated list of supported extensions to GL.

Because GL does not include queries for the performance characteristics of an implementation, it is expected that some applications will be written to recognize known platforms and will modify their GL usage based on known performance characteristics of these platforms. Strings **GL_VENDOR** and **GL_RENDERER** together uniquely specify a platform, and will not change from release to release. They should be used by such platform recognition algorithms. The format and contents of the **GL_VENDOR** and the **GL_RENDERER** strings depend on the implementation.

Some applications will want to make use of features which are not part of the standard GL. These features are may be implemented as extensions to the standard GL. The **GL_EXTENSIONS** string is a space seperated list of supported GL extensions. (Extension names never contain a space character.)

The **GL_VERSION** string begins with a version number. The version number is of the form *major_number*.*minor_number* or *major_number*.*minor_number*.*release_number*. Vendor specific information may follow the version number. It's format depends on the implementation, but a space always seperates the version number and the vendor specific information.

All strings are null-terminated.

NOTES

If an error is generated, **glGetString** returns zero.

The client and server may support different versions or extensions. **glGetString** always returns a compatible version number or list of extensions. The release number always describes the server.

ERRORS

GL_INVALID_ENUM is generated if *name* is not an accepted value.

GL_INVALID_OPERATION is generated if **glGetString** is called between a call to **glBegin** and the corresponding call to **glEnd**.

---

back to the **OpenGL index page**

---

glGetTexImage

NAME

glGetTexImage -- return a texture image

C SPECIFICATION

```
void glGetTexImage(GLenum target,
                   GLint level,
                   GLenum format,
                   GLenum type,
                   GLvoid *pixels)
```

PARAMETERS

target
: Specifies which texture is to be obtained. **GL_TEXTURE_1D** and **GL_TEXTURE_2D** are accepted.

level
: Specifies the level-of-detail number of the desired image. Level 0 is the base image level. Level *n* is the *n*th mipmap reduction image.

format
: Specifies a pixel format for the returned data. The supported formats are **GL_RED**, **GL_GREEN**, **GL_BLUE**, **GL_ALPHA**, **GL_RGB**, **GL_RGBA**, **GL_LUMINANCE**, and **GL_LUMINANCE_ALPHA**.

type
: Specifies a pixel type for the returned data. The supported types are **GL_UNSIGNED_BYTE**, **GL_BYTE**, **GL_UNSIGNED_SHORT**, **GL_SHORT**, **GL_UNSIGNED_INT**, **GL_INT**, and **GL_FLOAT**.

pixels
: Returns the texture image. Should be a pointer to an array of the type specified by *type*.

DESCRIPTION

glGetTexImage returns a texture image into pixels. *target* specifies whether the desired texture image is one specified by **glTexImage1D** (GL_TEXTURE_1D) or by **glTexImage2D** (GL_TEXTURE_2D). *level* specifies the level-of-detail number of the desired image. *format* and *type* specify the format and type of the desired image array. Please see the reference pages **glTexImage1D** and **glDrawPixels** for a description of the acceptable values for the *format* and *type* parameters, respectively.

Operation of **glGetTexImage** is best understood by considering the selected internal four-component texture image to be an RGBA color buffer the size of the image. The semantics of **glGetTexImage** are then identical to those of **glReadPixels** called with the same *format* and *type*, with *x* and *y* set to zero, *width* set to the width of the texture image (including border if one was specified), and *height* set to one for 1-D images, or to the height of the texture image (including border if one was specified) for 2-D images. Because the internal texture image is an RGBA image, pixel formats **GL_COLOR_INDEX**, **GL_STENCIL_INDEX**, and **GL_DEPTH_COMPONENT** are not accepted, and pixel type **GL_BITMAP** is not accepted.

If the selected texture image does not contain four components, the following mappings are applied. Single-component textures are treated as RGBA buffers with red set to the single-component value, and green, blue and alpha set to zero. Two-component textures are treated as RGBA buffers with red set to the value of component zero, alpha set to the value of component one, and green and blue set to zero. Finally, three-component textures are treated as RGBA buffers with red set to component zero, green set to component one, blue set to component two, and alpha set to zero.

To determine the required size of *pixels*, use **glGetTexLevelParameter** to ascertain the dimensions of the internal texture image, then scale the required number of pixels by the storage required for each pixel, based on *format* and *type*. Be sure to take the pixel storage parameters into account, especially **GL_PACK_ALIGNMENT**.

NOTES

If an error is generated, no change is made to the contents of *pixels*.

ERRORS

GL_INVALID_ENUM is generated if *target*, *format* or *type* is not an accepted value.

GL_INVALID_VALUE is generated if *level* is less than zero or greater than ld *max*, where *max* is the returned value of **GL_MAX_TEXTURE_SIZE**.

GL_INVALID_OPERATION is generated if **glGetTexImage** is called between a call to **glBegin** and the corresponding call to **glEnd**.

ASSOCIATED GETS

glGetTexGen

NAME

glGetTexGendv, **glGetTexGenfv**, **glGetTexGeniv** -- return texture coordinate generation parameters

C SPECIFICATION

```
void glGetTexGendv(GLenum coord,
                   GLenum pname,
                   GLdouble *params)
void glGetTexGenfv(GLenum coord,
                   GLenum pname,
                   GLfloat *params)
void glGetTexGeniv(GLenum coord,
                   GLenum pname,
                   GLint *params)
```

PARAMETERS

coord
: Specifies a texture coordinate. Must be **GL_S**, **GL_T**, **GL_R**, or **GL_Q**.

pname
: Specifies the symbolic name of the value(s) to be returned. Must be either **GL_TEXTURE_GEN_MODE** or the name of one of the texture generation plane equations: **GL_OBJECT_PLANE** or **GL_EYE_PLANE**.

params
: Returns the requested data.

DESCRIPTION

glGetTexGen returns in *params* selected parameters of a texture coordinate generation function that was specified using **glTexGen**. *coord* names one of the (*s*,*t*,*r*,*q*) texture coordinates, using the symbolic constant **GL_S**, **GL_T**, **GL_R**, or **GL_Q**.

pname specifies one of three symbolic names:

GL_TEXTURE_GEN_MODE
: *params* returns the single-valued texture generation function, a symbolic constant.

GL_OBJECT_PLANE
: *params* returns the four plane equation coefficients that specify object linear-coordinate generation. Integer values, when requested, are mapped directly from the internal floating-point representation.

GL_EYE_PLANE
: *params* returns the four plane equation coefficients that specify eye linear-coordinate generation. Integer values, when requested, are mapped directly from the internal floating-point representation. The returned values are those maintained in eye coordinates. They are not equal to the values specified using **glTexGen**, unless the modelview matrix was identity at the time **glTexGen** was called.

NOTES

If an error is generated, no change is made to the contents of *params*.

ERRORS

GL_INVALID_ENUM is generated if *coord* or *pname* is not an accepted value.

GL_INVALID_OPERATION is generated if **glTexGen** is called between a call to **glBegin** and the corresponding call to **glEnd**.

SEE ALSO

glTexGen

---

glGetTexParameter

NAME

glGetTexParameterfv, **glGetTexParameteriv** -- return texture parameter values

C SPECIFICATION

```
void glGetTexParameterfv(GLenum target,
                         GLenum pname,
                         GLfloat *params)
void glGetTexParameteriv(GLenum target,
                         GLenum pname,
                         GLint *params)
```

PARAMETERS

target
: Specifies the symbolic name of the target texture. **GL_TEXTURE_1D** and **GL_TEXTURE_2D are accepted**.

pname
: Specifies the symbolic name of a texture parameter. **GL_TEXTURE_MAG_FILTER**, **GL_TEXTURE_MIN_FILTER**, **GL_TEXTURE_WRAP_S**, **GL_TEXTURE_WRAP_T**, and **GL_TEXTURE_BORDER_COLOR** are accepted.

params
: Returns the texture parameters.

DESCRIPTION

glGetTexParameter returns in *params* the value or values of the texture parameter specified as *pname*. *target* defines the target texture either **GL_TEXTURE_1D** or **GL_TEXTURE_2D** to specify one- or two-dimensional texturing. *pname* accepts the same symbols as **glTexParameter**, with the same interpretations:

GL_TEXTURE_MAG_FILTER
: Returns the single-valued texture magnification filter, a symbolic constant.

GL_TEXTURE_MIN_FILTER
: Returns the single-valued texture minification filter, a symbolic constant.

GL_TEXTURE_WRAP_S
: Returns the single-valued wrapping function for texture coordinate *s*, a symbolic constant.

GL_TEXTURE_WRAP_T
: Returns the single-valued wrapping function for texture coordinate *t*, a symbolic constant.

GL_TEXTURE_BORDER_COLOR
: Returns four integer or floating-point numbers that comprise the RGBA color of the texture border. Floating-point values are returned in the range [0, 1]. Integer values are returned as a linear mapping of the internal floating-point representation such that 1.0 maps to the most positive representable integer and -1.0 maps to the most negative representable integer.

NOTES

If an error is generated, no change is made to the contents of *params*.

ERRORS

GL_INVALID_ENUM is generated if *target* or *pname* is not an accepted value.

GL_INVALID_OPERATION is generated if **glGetTexParameter** is called between a call to **glBegin** and the corresponding call to **glEnd**.

glGetTexLevelParameter

NAME

glGetTexLevelParameterfv, **glGetTexLevelParameteriv** -- return texture parameter values for a specific level of detail

C SPECIFICATION

```
void glGetTexLevelParameterfv(GLenum target,
                              GLint level,
                              GLenum pname,
                              GLfloat *params)
void glGetTexLevelParameteriv(GLenum target,
                              GLint level,
                              GLenum pname,
                              GLint *params)
```

PARAMETERS

target
: Specifies the symbolic name of the target texture, either **GL_TEXTURE_1D** or **GL_TEXTURE_2D**.

level
: Specifies the level-of-detail number of the desired image. Level 0 is the base image level. Level *n* is the *n*th mipmap reduction image.

pname
: Specifies the symbolic name of a texture parameter. **GL_TEXTURE_WIDTH**, **GL_TEXTURE_HEIGHT**, **GL_TEXTURE_COMPONENTS** and **GL_TEXTURE_BORDER** are accepted.

params
: Returns the requested data.

DESCRIPTION

glGetTexLevelParameter returns in *params* texture parameter values for a specific level-of-detail value, specified as *level*. *target* defines the target texture, either **GL_TEXTURE_1D** or **GL_TEXTURE_2D**, to specify one- or two-dimensional texturing. *pname* specifies the texture parameter whose value or values will be returned.

The accepted parameter names are as follows:

GL_TEXTURE_WIDTH
: *params* returns a single value, the width of the texture image. This value includes the border of the texture image.

GL_TEXTURE_HEIGHT
: *params* returns a single value, the height of the texture image. This value includes the border of the texture image.

GL_TEXTURE_COMPONENTS
: *params* returns a single value, the number of components in the texture image.

GL_TEXTURE_BORDER

params returns a single value, the width in pixels of the border of the texture image.

NOTES

If an error is generated, no change is made to the contents of *params*.

ERRORS

GL_INVALID_ENUM is generated if *target* or *pname* is not an accepted value.

GL_INVALID_VALUE is generated if *level* is less than zero or greater than ld *max*, where *max* is the returned value of **GL_MAX_TEXTURE_SIZE**.

GL_INVALID_OPERATION is generated if **glGetTexLevelParamter** is called between a call to **glBegin** and the corresponding call to **glEnd**.

glIndex

NAME

glIndexd, **glIndexf**, **glIndexi**, **glIndexs**, **glIndexdv**, **glIndexfv**, **glIndexiv**, **glIndexsv** -- set the current color index

C SPECIFICATION

```
void glIndexd(GLdouble c)
void glIndexf(GLfloat c)
void glIndexi(GLint c)
void glIndexs(GLshort c)
```

PARAMETERS

c
Specifies the new value for the current color index.

C SPECIFICATION

```
void glIndexdv(const GLdouble *c)
void glIndexfv(const GLfloat *c)
void glIndexiv(const GLint *c)
void glIndexsv(const GLshort *c)
```

PARAMETERS

c
Specifies a pointer to a one-element array that contains the new value for the current color index.

DESCRIPTION

glIndex updates the current (single-valued) color index. It takes one argument: the new value for the current color index.

The current index is stored as a floating-point value. Integer values are converted directly to floating-point values, with no special mapping.

Index values outside the representable range of the color index buffer are not clamped. However, before an index is dithered (if enabled) and written to the frame buffer, it is converted to fixed-point format. Any bits in the integer portion of the resulting fixed-point value that do not correspond to bits in the frame buffer are masked out.

NOTES

The current index can be updated at any time. In particular, **glIndex** can be called between a call to **glBegin** and the corresponding call to **glEnd**.

ASSOCIATED GETS

glGet with argument **GL_CURRENT_INDEX**

SEE ALSO

glColor

---

back to the **OpenGL index page**

---

glHint

NAME

glHint -- specify implementation-specific hints

C SPECIFICATION

```
void glHint(GLenum target,
            GLenum mod)
```

PARAMETERS

target
: Specifies a symbolic constant indicating the behavior to be controlled. **GL_FOG_HINT**, **GL_LINE_SMOOTH_HINT**, **GL_PERSPECTIVE_CORRECTION_HINT**, **GL_POINT_SMOOTH_HINT**, and **GL_POLYGON_SMOOTH_HINT** are accepted.

mode
: Specifies a symbolic constant indicating the desired behavior. **GL_FASTEST**, **GL_NICEST**, and **GL_DONT_CARE** are accepted.

DESCRIPTION

Certain aspects of GL behavior, when there is room for interpretation, can be controlled with hints. A hint is specified with two arguments. *target* is a symbolic constant indicating the behavior to be controlled, and *mode* is another symbolic constant indicating the desired behavior. *mode* can be one of the following:

GL_FASTEST
: The most efficient option should be chosen.

GL_NICEST
: The most correct, or highest quality, option should be chosen.

GL_DONT_CARE
: The client doesn't have a preference.

Though the implementation aspects that can be hinted are well defined, the interpretation of the hints depends on the implementation. The hint aspects that can be specified with *target*, along with suggested semantics, are as follows:

GL_FOG_HINT
: Indicates the accuracy of fog calculation. If per-pixel fog calculation is not efficiently supported by the GL implementation, hinting **GL_DONT_CARE** or **GL_FASTEST** can result in per-vertex calculation of fog effects.

GL_LINE_SMOOTH_HINT
: Indicates the sampling quality of antialiased lines. Hinting **GL_NICEST** can result in more pixel fragments being generated during rasterization, if a larger filter function is applied.

GL_PERSPECTIVE_CORRECTION_HINT
: Indicates the quality of color and texture coordinate interpolation. If perspective-corrected parameter interpolation is not efficiently supported by the GL implementation, hinting **GL_DONT_CARE** or

GL_FASTEST can result in simple linear interpolation of colors and/or texture coordinates.

GL_POINT_SMOOTH_HINT
Indicates the sampling quality of antialiased points. Hinting **GL_NICEST** can result in more pixel fragments being generated during rasterization, if a larger filter function is applied.

GL_POLYGON_SMOOTH_HINT
Indicates the sampling quality of antialiased polygons. Hinting **GL_NICEST** can result in more pixel fragments being generated during rasterization, if a larger filter function is applied.

NOTES

The interpretation of hints depends on the implementation. **glHint** can be ignored.

ERRORS

GL_INVALID_ENUM is generated if *target* or *mode* is not an accepted value.

GL_INVALID_OPERATION is generated if **glHint** is called between a call to **glBegin** and the corresponding call to **glEnd**.

---

back to the **OpenGL index page**

---

glInitNames

NAME

glInitNames -- initialize the name stack

C SPECIFICATION

```
void glInitNames(void void)
```

DESCRIPTION

The name stack is used during selection mode to allow sets of rendering commands to be uniquely identified. It consists of an ordered set of unsigned integers. **glInitNames** causes the name stack to be initialized to its default empty state.

The name stack is always empty while the render mode is not **GL_SELECT**. Calls to **glInitNames** while the render mode is not **GL_SELECT** are ignored.

ERRORS

GL_INVALID_OPERATION is generated if **glInitNames** is called between a call to **glBegin** and the corresponding call to **glEnd**.

glIndexMask

NAME

glIndexMask -- control the writing of individual bits in the color index buffers

C SPECIFICATION

```
void glIndexMask(GLuint mask)
```

PARAMETERS

mask
: Specifies a bit mask to enable and disable the writing of individual bits in the color index buffers. Initially, the mask is all ones.

DESCRIPTION

glIndexMask controls the writing of individual bits in the color index buffers. The least significant *n* bits of *mask*, where *n* is the number of bits in a color index buffer, specify a mask. Wherever a one appears in the mask, the corresponding bit in the color index buffer (or buffers) is made writable. Where a zero appears, the bit is write-protected.

This mask is used only in color index mode, and it affects only the buffers currently selected for writing (see **glBegin** and the corresponding call to **glEnd**.

                   GLfloat param)
void glLightModeli(GLenum pname,
                   GLint param)
```

PARAMETERS

pname
: Specifies a single-valued lighting model parameter. **GL_LIGHT_MODEL_LOCAL_VIEWER** and **GL_LIGHT_MODEL_TWO_SIDE** are accepted.

param
: Specifies the value that *param* will be set to.

C SPECIFICATION

```
void glLightModelfv(GLenum pname,
                    const GLfloat *params)
void glLightModeliv(GLenum pname,
                    const GLint *params)
```

PARAMETERS

pname
: Specifies a lighting model parameter. **GL_LIGHT_MODEL_AMBIENT**, **GL_LIGHT_MODEL_LOCAL_VIEWER** and **GL_LIGHT_MODEL_TWO_SIDE** are accepted.

params
: Specifies a pointer to the value that *params* will be set to.

DESCRIPTION

glLightModel sets the lighting model parameter. *pname* names a parameter and *params* gives the new value. There are three lighting model parameters:

GL_LIGHT_MODEL_AMBIENT
: *params* contains four integer or floating-point values that specify the ambient RGBA intensity of the entire scene. Integer values are mapped linearly such that the most positive representable value maps to 1.0, and the most negative representable value maps to -1.0. Floating-point values are mapped directly. Neither integer nor floating-point values are clamped. The default ambient scene intensity is (0.2, 0.2, 0.2, 1.0)

GL_LIGHT_MODEL_LOCAL_VIEWER
: *params* is a single integer or floating-point value that specifies how specular reflection angles are computed. If *params* is 0 (or 0.0), specular reflection angles take the view direction to be parallel to and in the direction of the -*z* axis, regardless of the location of the vertex in eye coordinates. Otherwise specular reflections are computed

from the origin of the eye coordinate system. The default is 0.

GL_LIGHT_MODEL_TWO_SIDE
params is a single integer or floating-point value that specifies whether one- or two-sided lighting calculations are done for polygons. It has no effect on the lighting calculations for points, lines, or bitmaps. If params is 0 (or 0.0), one-sided lighting is specified, and only the front material parameters are used in the lighting equation. Otherwise, two-sided lighting is specified. In this case, vertices of back-facing polygons are lighted using the back material parameters, and have their normals reversed before the lighting equation is evaluated. Vertices of front-facing polygons are always lighted using the front material parameters, with no change to their normals. The default is 0.

In RGBA mode, the lighted color of a vertex is the sum of the material emission intensity, the product of the material ambient reflectance and the lighting model full-scene ambient intensity, and the contribution of each enabled light source. Each light source contributes the sum of three terms: ambient, diffuse, and specular. The ambient light source contribution is the product of the material ambient reflectance and the light's ambient intensity. The diffuse light source contribution is the product of the material diffuse reflectance, the light's diffuse intensity, and the dot product of the vertex's normal with the normalized vector from the vertex to the light source. The specular light sourcecontribution is the product of the material specular reflectance, the light's specular intensity, and the dot product of the normalized vertex-to-eye and vertex-to-light vectors, raised to the power of the shininess of the material. All three light source contributions are attenuated equally based on the distance from the vertex to the light source and on light source direction, spread exponent, and spread cutoff angle. All dot products are replaced with zero if they evaluate to a negative value.

The alpha component of the resulting lighted color is set to the alpha value of the material diffuse reflectance.

In color index mode, the value of the lighted index of a vertex ranges from the ambient to the specular values passed to **glMaterial** using **GL_COLOR_INDEXES**. Diffuse and specular coefficients, computed with a (.30, .59, .11) weighting of the lights' colors, the shininess of the material, and the same reflection and attenuation equations as in the RGBA case, determine how much above ambient the resulting index is.

ERRORS

GL_INVALID_ENUM is generated if *pname* is not an accepted value.

GL_INVALID_OPERATION is generated if **glLightModel** is called between a call to **glBegin** and the corresponding call to **glEnd**.

glLight

NAME

glLightf, **glLighti**, **glLightfv**, **glLightiv** -- set light source parameters

C SPECIFICATION

```
void glLightf(GLenum light,
              GLenum pname,
              GLfloat param)
void glLighti(GLenum light,
              GLenum pname,
              GLint param)
```

PARAMETERS

light
: Specifies a light. The number of lights is depends on the implementation, but at least eight lights are supported. They are identified by symbolic names of the form **GL_LIGHT***i* where 0 <= *i* < **GL_MAX_LIGHTS**.

pname
: Specifies a single-valued light source parameter for *light*. **GL_SPOT_EXPONENT**, **GL_SPOT_CUTOFF**, **GL_CONSTANT_ATTENUATION**, **GL_LINEAR_ATTENUATION**, and **GL_QUADRATIC_ATTENUATION** are accepted.

param
: Specifies the value that parameter *pname* of light source *light* will be set to.

C SPECIFICATION

```
void glLightfv(GLenum light,
               GLenum pname,
               const GLfloat *params)
void glLightiv(GLenum light,
               GLenum pname,
               const GLint *params)
```

PARAMETERS

light
: Specifies a light. The number of lights is depends on the implementation, but at least eight lights are supported. They are identified by symbolic names of the form **GL_LIGHT***i* where 0 <= *i* < **GL_MAX_LIGHTS**.

pname
: Specifies a light source parameter for *light*. **GL_AMBIENT**, **GL_DIFFUSE**, **GL_SPECULAR**, **GL_POSITION**, **GL_SPOT_DIRECTION**, **GL_SPOT_EXPONENT**, **GL_SPOT_CUTOFF**, **GL_CONSTANT_ATTENUATION**, **GL_LINEAR_ATTENUATION**, and **GL_QUADRATIC_ATTENUATION** are accepted.

params
: Specifies a pointer to the value or values that parameter *pname* of light source *light* will be set to.

DESCRIPTION

glLight sets the values of individual light source parameters. *light* names the light and is a symbolic name of the form **GL_LIGHT***i*, where 0 <= *i* < **GL_MAX_LIGHTS**. *pname* specifies one of ten light source parameters, again by symbolic name. *params* is either a single value or a pointer to an array that contains the new values.

Lighting calculation is enabled and disabled using **glEnable** and **glDisable** with argument **GL_LIGHTING**. When lighting is enabled, light sources that are enabled contribute to the lighting calculation. Light source *i* is enabled and disabled using **glEnable** and **glDisable** with argument **GL_LIGHT***i*.

The ten light parameters are as follows:

GL_AMBIENT

params contains four integer or floating-point values that specify the ambient RGBA intensity of the light. Integer values are mapped linearly such that the most positive representable value maps to 1.0, and the most negative representable value maps to -1.0. Floating-point values are mapped directly. Neither integer nor floating-point values are clamped. The default ambient light intensity is (0.0, 0.0, 0.0, 1.0).

GL_DIFFUSE

params contains four integer or floating-point values that specify the diffuse RGBA intensity of the light. Integer values are mapped linearly such that the most positive representable value maps to 1.0, and the most negative representable value maps to -1.0. Floating-point values are mapped directly. Neither integer nor floating-point values are clamped. The default diffuse intensity is (0.0, 0.0, 0.0, 1.0) for all lights other than light zero. The default diffuse intensity of light zero is (1.0, 1.0, 1.0, 1.0).

GL_SPECULAR

params contains four integer or floating-point values that specify the specular RGBA intensity of the light. Integer values are mapped linearly such that the most positive representable value maps to 1.0, and the most negative representable value maps to -1.0. Floating-point values are mapped directly. Neither integer nor floating-point values are clamped. The default specular intensity is (0.0, 0.0, 0.0, 1.0) for all lights other than light zero. The default specular intensity of light zero is (1.0, 1.0, 1.0, 1.0).

GL_POSITION

params contains four integer or floating-point values that specify the position of the light in homogeneous object coordinates. Both integer and floating-point values are mapped directly. Neither integer nor floating-point values are clamped.

The position is transformed by the modelview matrix when **glLight** is called (just as if it were a point), and it is stored in eye coordinates. If the *w* component of the position is 0.0, the light is treated as a directional source. Diffuse and specular lighting calculations take the light's direction, but not its actual position, into account, and attenuation is disabled. Otherwise, diffuse and specular lighting calculations are based on the actual location of the light in eye coordinates, and attenuation is enabled. The default position is (0,0,1,0); thus, the default light source is directional, parallel to, and in the direction of the -*z* axis.

GL_SPOT_DIRECTION

params contains three integer or floating-point values that specify the direction of the light in homogeneous object coordinates. Both integer and floating-point values are mapped directly. Neither integer nor floating-point values are clamped.

The spot direction is transformed by the inverse of the modelview matrix when **glLight** is called (just as it it were a normal), and it is stored in eye coordinates. It is significant only when **GL_SPOT_CUTOFF** is not 180, which it is by default. The default direction is (0,0,-1).

GL_SPOT_EXPONENT

params is a single integer or floating-point value that specifies the intensity distribution of the light. Integer and floating-point values are mapped directly. Only values in the range [0, 128] are accepted.

Effective light intensity is attenuated by the cosine of the angle between the direction of the light and the direction from the light to the vertex being lighted, raised to the power of the spot exponent. Thus, higher spot exponents result in a more focused light source, regardless of the spot cutoff angle (see next paragraph). The default spot exponent is 0, resulting in uniform light distribution.

GL_SPOT_CUTOFF
params is a single integer or floating-point value that specifies the maximum spread angle of a light source. Integer and floating-point values are mapped directly. Only values in the range [0, 90], and the special value 180, are accepted. If the angle between the direction of the light and the direction from the light to the vertex being lighted is greater than the spot cutoff angle, the light is completely masked. Otherwise, its intensity is controlled by the spot exponent and the attenuation factors. The default spot cutoff is 180, resulting in uniform light distribution.

GL_CONSTANT_ATTENUATION

GL_LINEAR_ATTENUATION

GL_QUADRATIC_ATTENUATION
params is a single integer or floating-point value that specifies one of the three light attenuation factors. Integer and floating-point values are mapped directly. Only nonnegative values are accepted. If the light is positional, rather than directional, its intensity is attenuated by the reciprocal of the sum of: the constant factor, the linear factor times the distance between the light and the vertex being lighted, and the quadratic factor times the square of the same distance. The default attenuation factors are (1,0,0), resulting in no attenuation.

NOTES

It is always the case that **GL_LIGHT***i* = **GL_LIGHT0** + *i*.

ERRORS

GL_INVALID_ENUM is generated if either *light* or *pname* is not an accepted value.

GL_INVALID_VALUE is generated if a spot exponent value is specified outside the range [0, 180], or if spot cutoff is specified outside the range [0, 90] (except for the special value 180), or if a negative attenuation factor is specified.

GL_INVALID_OPERATION is generated if **glLight** is called between a call to **glBegin** and the corresponding call to **glEnd**.

glLineWidth

NAME

glLineWidth -- specify the width of rasterized lines

C SPECIFICATION

```
void glLineWidth(GLfloat width)
```

PARAMETERS

width
    Specifies the width of rasterized lines. The default is 1.0.

DESCRIPTION

glLineWidth specifies the rasterized width of both aliased and antialiased lines. Using a line width other than 1.0 has different effects, depending on whether line antialiasing is enabled. Line antialiasing is controlled by calling **glEnable** and **glDisable** with argument **GL_LINE_SMOOTH**.

If line antialiasing is disabled, the actual width is determined by rounding the supplied width to the nearest integer. (If the rounding results in the value 0, it is as if the line width were 1.) If |*dx*| >= |*dy*| *i* pixels are filled in each column that is rasterized, where *i* is the rounded value of *width*. Otherwise, *i* pixels are filled in each row that is rasterized.

If antialiasing is enabled, line rasterization produces a fragment for each pixel square that intersects the region lying within the rectangle having width equal to the current line width, length equal to the actual length of the line, and centered on the mathematical line segment. The coverage value for each fragment is the window coordinate area of the intersection of the rectangular region with the corresponding pixel square. This value is saved and used in the final rasterization step.

Not all widths can be supported when line antialiasing is enabled. If an unsupported width is requested, the nearest supported width is used. Only width 1.0 is guaranteed to be supported; others depend on the implementation. The range of supported widths and the size difference between supported widths within the range can be queried by calling **glGet** with arguments **GL_LINE_WIDTH_RANGE** and **GL_LINE_WIDTH_GRANULARITY**.

NOTES

The line width specified by **glLineWidth** is always returned when **GL_LINE_WIDTH** is queried. Clamping and rounding for aliased and antialiased lines have no effect on the specified value.

Non-antialiased line width may be clamped to an implementation-dependent maximum. Although this maximum cannot be queried, it must be no less than the maximum value for antialiased lines, rounded to the nearest integer value.

ERRORS

GL_INVALID_VALUE is generated if *width* is less than or equal to zero.

GL_INVALID_OPERATION is generated if **glineWidth** is called between a call to **glBegin** and the corresponding call to **glEnd**.

glLineStipple

NAME

glLineStipple -- specify the line stipple pattern

C SPECIFICATION

```
void glLineStipple(GLint factor,
                   GLushort pattern)
```

PARAMETERS

factor
: Specifies a multiplier for each bit in the line stipple pattern. If factor is 3, for example, each bit in the pattern will be used three times before the next bit in the pattern is used. *factor* is clamped to the range [1, 256] and defaults to one.

pattern
: Specifies a 16-bit integer whose bit pattern determines which fragments of a line will be drawn when the line is rasterized. Bit zero is used first, and the default pattern is all ones.

DESCRIPTION

Line stippling masks out certain fragments produced by rasterization; those fragments will not be drawn. The masking is achieved by using three parameters: the 16-bit line stipple pattern *pattern*, the repeat count *factor*, and an integer stipple counter *s*.

Counter *s* is reset to zero whenever **glBegin** is called, and before each line segment of a **glBegin**(**GL_LINES**) / **glEnd** sequence is generated. It is incremented after each fragment of a unit *width* aliased line segment is generated, or after each *i* fragments of an *i* *width* line segment are generated. The *i* fragments associated with count *s* are masked out if

pattern bit (*s* / *factor*) mod 16

is zero, otherwise these fragments are sent to the frame buffer. Bit zero of *pattern* is the least significant bit.

Antialiased lines are treated as a sequence of 1**width* rectangles for purposes of stippling. Rectangle *s* is rasterized or not based on the fragment rule described for aliased lines, counting rectangles rather than groups of fragments.

Line stippling is enabled or disabled using **glEnable** and **glDisable** with argument **GL_LINE_STIPPLE**. When enabled, the line stipple pattern is applied as described above. When disabled, it is as if the pattern were all ones. Initially, line stippling is disabled.

ERRORS

GL_INVALID_OPERATION is generated if **glLineStipple** is called between a call to **glBegin** and the corresponding call to **glEnd**.

glLoadIdentity

NAME

glLoadIdentity -- replace the current matrix with the identity matrix

C SPECIFICATION

```
void glLoadIdentity(void void)
```

DESCRIPTION

glLoadIdentity replaces the current matrix with the identity matrix. It is semantically equivalent to calling glLoadMatrix with the identity matrix

$$\begin{pmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{pmatrix}$$

but in some cases it is more efficient.

glListBase

NAME

glListBase -- set the display-list base for **glCallLists**

C SPECIFICATION

```
void glListBase(GLuint base)
```

PARAMETERS

base
: Specifies an integer offset that will be added to **glCallLists** offsets to generate display-list names. Initial value is zero.

DESCRIPTION

glCallLists specifies an array of offsets. Display-list names are generated by adding *base* to each offset. Names that reference valid display lists are executed; the others are ignored.

ERRORS

GL_INVALID_OPERATION is generated if **glListBase** is called between a call to **glBegin** and the corresponding call to **glEnd**.

glLoadName

NAME

glLoadName -- load a name onto the name stack

C SPECIFICATION

`void glLoadName(GLuint name)`

PARAMETERS

name
Specifies a name that will replace the top value on the name stack.

DESCRIPTION

The name stack is used during selection mode to allow sets of rendering commands to be uniquely identified. It consists of an ordered set of unsigned integers. **glLoadName** causes *name* to replace the value on the top of the name stack, which is initially empty.

The name stack is always empty while the render mode is not **GL_SELECT**. Calls to **glLoadName** while the render mode is not **GL_SELECT** are ignored.

ERRORS

GL_INVALID_OPERATION is generated if **glLoadName** is called while the name stack is empty.

GL_INVALID_OPERATION is generated if **glLoadName** is called between a call to **glBegin** and the corresponding call to **glEnd**.

glLoadMatrix

NAME

glLoadMatrix, glLoadMatrixf -- replace the current matrix with an arbitrary matrix

C SPECIFICATION

```
void glLoadMatrixd(GLdouble *m)
void glLoadMatrixf(GLfloat *m)
```

PARAMETERS

m

Specifies a pointer to a 4x4 matrix stored in column-major order as sixteen consecutive values.

DESCRIPTION

glLoadMatrix replaces the current matrix with the one specified in *m*. The current matrix is the projection matrix, modelview matrix, or texture matrix, determined by the current matrix mode (see **glMatrixMode**).

m points to a 4x4 matrix of single- or double-precision floating-point values stored in column-major order. That is, the matrix is stored as follows:

$$\begin{pmatrix} a_0 & a_4 & a_8 & a_{12} \\ a_1 & a_5 & a_9 & a_{13} \\ a_2 & a_6 & a_{10} & a_{14} \\ a_3 & a_7 & a_{11} & a_{15} \end{pmatrix}$$

glMap1

NAME

glMap1 -- define a one-dimensional evaluator

C SPECIFICATION

```
void glMap1d(GLenum target,
             GLdouble u1,
             GLdouble u2,
             GLint stride,
             GLint order,
             const GLdouble *points)
void glMap1f(GLenum target,
             GLdouble u1,
             GLdouble u2,
             GLint stride,
             GLint order,
             const GLfloat *points)
```

PARAMETERS

target
: Specifies the kind of values that are generated by the evaluator. Symbolic constants **GL_MAP1_VERTEX_3**, **GL_MAP1_VERTEX_4**, **GL_MAP1_INDEX**, **GL_MAP1_COLOR_4**, **GL_MAP1_NORMAL**, **GL_MAP1_TEXTURE_COORD_1**, **GL_MAP1_TEXTURE_COORD_2**, **GL_MAP1_TEXTURE_COORD_3**, and **GL_MAP1_TEXTURE_COORD_4** are accepted.

u1, *u2*
: Specify a linear mapping of *u*, as presented to **glEvalCoord1**, to *u*^, the variable that is evaluated by the equations specified by this command.

stride
: Specifies the number of floats or doubles between the beginning of one control point and the beginning of the next one in the data structure referenced in points. This allows control points to be embedded in arbitrary data structures. The only constraint is that the values for a particular control point must occupy contiguous memory locations.

order
: Specifies the number of control points. Must be positive.

points
: Specifies a pointer to the array of control points.

DESCRIPTION

Evaluators provide a way to use polynomial or rational polynomial mapping to produce vertices, normals, texture coordinates, and colors. The values produced by an evaluator are sent to further stages of GL processing just as if they had been presented using **glVertex**, **glNormal**, **glTexCoord**, and **glColor**, commands, except that the generated values do not update the current normal, texture coordinates, or color.

All polynomial or rational polynomial splines of any degree (up to the maximum degree supported by the GL implementation) can be described using evaluators. These include almost all splines used in computer graphics, including B-splines,Bezier curves, Hermite splines, and so on.

Evaluators define curves based on Bernstein polynomials. Define *p*(*u*^) as

$$p(\hat{u}) = \sum_{i=0}^{n} B_i^n(\hat{u}) R_i$$

Where *Ri* is a control point and *Bni*(*u*^) is the *i*th Bernstein polynomial of degree *n* (*order* = *n* + 1):

$$B_i^n(\hat{u}) = \binom{n}{i} \hat{u}^i (1 - \hat{u})^{n-i}$$

Recall that

$$0^0 \equiv 1 \quad \text{and} \quad \binom{n}{0} \equiv 1$$

glMap1 is used to define the basis and to specify what kind of values are produced. Once defined, a map can be enabled and disabled by calling **glEnable** and **glDisable** with the map name, one of the nine predefined values for *target* described below. **glEvalCoord1** evaluates the one-dimensional maps that are enabled. When **glEvalCoord1** presents a value *u* the Bernstein functions are evaluated using *u*^, where

$$\hat{u} = \frac{u - u1}{u2 - u1}$$

target is a symbolic constant that indicates what kind of control points are provided in *points*, and what output is generated when the map is evaluated. It can assume one of nine predefined values:

GL_MAP1_VERTEX_3
: Each control point is three floating-point values representing *x*, *y*, and *z*. Internal **glVertex3** commands are generated when the map is evaluated.

GL_MAP1_VERTEX_4
: Each control point is four floating-point values representing *x*, *y*, *z*, and *w*. Internal **glVertex4** commands are generated when the map is evaluated.

GL_MAP1_INDEX
: Each control point is a single floating-point value representing a color index. Internal **glIndex** commands are generated when the map is evaluated. The current index is not updated with the value of these **glIndex** commands, however.

GL_MAP1_COLOR_4
: Each control point is four floating-point values representing red, green, blue, and alpha. Internal **glColor4** commands are generated when the map is evaluated. The current color is not updated with the value of these **glColor4** commands, however

GL_MAP1_NORMAL
: Each control point is three floating-point values representing the *x*, *y*, and *z* components of a normal vector. Internal **glNormal** commands are generated when the map is evaluated. The current normal is not updated with the value of these **glNormal** commands, however.

GL_MAP1_TEXTURE_COORD_1
: Each control point is a single floating-point value representing the *s* texture coordinate. Internal **glTexCoord1** commands are generated when the map is evaluated. The current texture coordinates are not updated with the value of these **glTexCoord** commands, however.

GL_MAP1_TEXTURE_COORD_2
Each control point is two floating-point values representing the *s* and *t* texture coordinates. Internal **glTexCoord2** commands are generated when the map is evaluated. The current texture coordinates are not updated with the value of these **glTexCoord** commands, however.

GL_MAP1_TEXTURE_COORD_3
Each control point is three floating-point values representing the *s*, t and *r* texture coordinates. Internal **glTexCoord3** commands are generated when the map is evaluated. The current texture coordinates are not updated with the value of these **glTexCoord** commands, however.

GL_MAP1_TEXTURE_COORD_4
Each control point is three floating-point values representing the *s*, t, *r* and *q* texture coordinates. Internal **glTexCoord4** commands are generated when the map is evaluated. The current texture coordinates are not updated with the value of these **glTexCoord** commands, however.

stride, *order*, and *points* define the array addressing for accessing the control points. *points* is the location of the first control point, which occupies one, two, three, or four contiguous memory locations, depending on which map is being defined. *order* is the number of control points in the array. *stride* tells how many float or double locations to advance the internal memory pointer to reach the next control point.

NOTES

As is the case with all GL commands that accept pointers to data, it is as if the contents of *points* were copied by **glMap1** before it returned. Changes to the contents of *points* have no effect after **glMap1** is called.

ERRORS

GL_INVALID_ENUM is generated if *target* is not an accepted value.

GL_INVALID_VALUE is generated if *u1* is equal to *u2*.

GL_INVALID_VALUE is generated if *stride* is less than the number of values in a control point.

GL_INVALID_VALUE is generated if *order* is less than one or greater than **GL_MAX_EVAL_ORDER**.

GL_INVALID_OPERATION is generated if **glMap1** is called between a call to **glBegin** and the corresponding call to **glEnd**.

glLogicOp

NAME

glLogicOp -- specify a logical pixel operation for rendering

C SPECIFICATION

```
void glLogicOp(GLenum opcode)
```

PARAMETERS

opcode
: Specifies a symbolic constant that selects a logical operation. The following symbols are accepted: **GL_CLEAR**, **GL_SET**, **GL_COPY**, **GL_COPY_INVERTED**, **GL_NOOP**, **GL_INVERT**, **GL_AND**, **GL_NAND**, **GL_OR**, **GL_NOR**, **GL_XOR**, **GL_EQUIV**, **GL_AND_REVERSE**, **GL_AND_INVERTED**, **GL_OR_REVERSE**, and **GL_OR_INVERTED**.

DESCRIPTION

glLogicOp specifies a logical operation that, when enabled, combines the incoming color index and the color index at the corresponding location in the frame buffer. The logical operation is enabled or disabled with **glEnable** and **glDisable** using the symbolic constant **GL_LOGIC_OP**.

opcode is a symbolic constant chosen from the list below. In the explanation of the logical operations, *s* represents the incoming color index and *d* represents the index in the frame buffer. Standard C-language operators are used. As these bitwise operators suggest, the logical operation is applied independently to each bit pair of the source and destination indices.

opcode	*resulting value*
GL_CLEAR	0
GL_SET	1
GL_COPY	s
GL_COPY_INVERTED	!s
GL_NOOP	d

NOTES

Logical pixel operations are not applied to RGBA color buffers.

When more than one color index buffer is enabled for drawing, logical operations are done separately for each enabled buffer, using for the destination index the contents of that buffer (see **glDrawBuffer**).

opcode mst be one of the sixteen accepted values. Other values result in an error.

ERRORS

GL_INVALID_ENUM is generated if *opcode* is not an accepted value.

GL_INVALID_OPERATION is generated if **glLogicOp** is called between a call to **glBegin** and the corresponding call to **glEnd**.

glMapGrid

NAME

glMapGrid1d, **glMapGrid1f**, **glMapGrid2d**, **glMapGrid2f** -- define a one- or two-dimensional mesh

C SPECIFICATION

```
void glMapGrid1d(GLint un,
                 GLdouble u1,
                 GLdouble u2)
void glMapGrid1f(GLint un,
                 GLfloat u1,
                 GLfloat u2)
void glMapGrid2d(GLint un,
                 GLdouble u1,
                 GLdouble u2,
                 GLint vn,
                 GLdouble v1,
                 GLdouble v2)
void glMapGrid2f(GLint un,
                 GLfloat u1,
                 GLfloat u2,
                 GLint vn,
                 GLfloat v1,
                 GLfloat v2)
```

PARAMETERS

un
: Specifies the number of partitions in the grid range interval [*u1*, *u2*]. Must be positive.

u1, *u2*
: Specify the mappings for integer grid domain values *i* = 0 and *i* = *un*.

vn
: Specifies the number of partitions in the grid range interval [*v1*, *v2*] (**glMapGrid2** only).

v1, *v2*
: Specify the mappings for integer grid domain values *j* = 0 and *j* = *vn* (**glMapGrid2** only).

DESCRIPTION

glMapGrid and **glEvalMesh** are used in tandem to efficiently generate and evaluate a series of evenly spaced map domain values. **glEvalMesh** steps through the integer domain of a one- or two-dimensional grid, whose range is the domain of the evaluation maps specified by **glMap1** and **glMap2**.

glMapGrid1 and **glMapGrid2** specify the linear grid mappings between the *i* (or *i* and *j*) integer grid coordinates, to the *u* (or *u* and *v*) floating-point evaluation map coordinates. See **glMap1** and **glMap2** for details of how *u* and *v* coordinates are evaluated.

glMapGrid1 specifies a single linear mapping such that integer grid coordinate 0 maps exactly to *u1*, and integer grid coordinate *un* maps exactly to *u2*. All other integer grid coordinates *i* are mapped such that

$$u = i(u2 - u1) / un + u1$$

glMapGrid2 specifies two such linear mappings. One maps integer grid coordinate *i* = 0 exactly to *u1*, and integer grid coordinate $i = un$ exactly to $u2$. The other maps integer grid coordinate $j = 0$ exactly to $v1$, and integer grid coordinate $j = vn$ exactly to $v2$. Other integer grid coordinates i and j are mapped such that

$$u = i(u2 - u1) / un + u1$$

$$v = j(v2 - v1) / vn + v1$$

The mappings specified by **glMapGrid** are used identically by **glEvalMesh** and **glEvalPoint**.

ERRORS

GL_INVALID_VALUE is generated if either *un* or *vn* is not positive.

GL_INVALID_OPERATION is generated if **glMapGrid** is called between a call to **glBegin** and the corresponding call to **glEnd**.

glMap2

NAME

glMap2d, **glMap2f** -- define a two-dimensional evaluator

C SPECIFICATION

```
void glMap2d(GLenum target,
             GLdouble u1,
             GLdouble u2,
             GLint ustride,
             GLint uorder,
             GLdouble v1,
             GLdouble v2,
             GLint vstride,
             GLint vorder,
             const GLdouble *points)
void glMap2f(GLenum target,
             GLdouble u1,
             GLdouble u2,
             GLint ustride,
             GLint uorder,
             GLdouble v1,
             GLdouble v2,
             GLint vstride,
             GLint vorder,
             const GLfloat *points)
```

PARAMETERS

target
: Specifies the kind of values that are generated by the evaluator. Symbolic constants **GL_MAP2_VERTEX_3**, **GL_MAP2_VERTEX_4**, **GL_MAP2_INDEX**, **GL_MAP2_COLOR_4**, **GL_MAP2_NORMAL**, **GL_MAP2_TEXTURE_COORD_1**, **GL_MAP2_TEXTURE_COORD_2**, **GL_MAP2_TEXTURE_COORD_3**, and **GL_MAP2_TEXTURE_COORD_4** are accepted.

u1, *u2*
: Specify a linear mapping of *u*, as presented to **glEvalCoord2**, to *u*^, one of the two variables that is evaluated by the equations specified by this command.

ustride
: Specifies the number of floats or doubles between the beginning of control point *Rij* and the beginning of control point *R*(*i*+1)*j*, where *i* and *j* are the *u* and *v* control point indices, respectively. This allows control points to be embedded in arbitrary data structures. The only constraint is that the values for a particular control point must occupy contiguous memory locations.

uorder
: Specifies the dimension of the control point array in the *u* axis. Must be positive.

v1, *v2*
: Specify a linear mapping of *v*, as presented to **glEvalCoord2**, to *v*^, one of the two variables that is evaluated by the equations specified by this command.

vstride
: Specifies the number of floats or doubles between the beginning of control point *Rij* and the beginning of control point *Ri*(*j*+1), where *i* and *j* are the *u* and *v* control point indices, respectively. This allows control points to be embedded in arbitrary data structures. The only constraint is that the values for a particular control point must

occupy contiguous memory locations.

vorder
Specifies the dimension of the control point array in the *v* axis. Must be positive.

points
Specifies a pointer to the array of control points.

DESCRIPTION

Evaluators provide a way to use polynomial or rational polynomial mapping to produce vertices, normals, texture coordinates, and colors. The values produced by an evaluator are sent on to further stages of GL processing just as if they had been presented using **glVertex**, **glNormal**, **glTexCoord**, and **glColor** commands, except that the generated values do not update the current normal, texture coordinates, or color.

All polynomial or rational polynomial splines of any degree (up to the maximum degree supported by the GL implementation) can be described using evaluators. These include almost all surfaces used in computer graphics, including B-spline surfaces, NURBS surfaces, Bezier surfaces, and so on.

Evaluators define surfaces based on bivariate Bernstein polynomials. Define *p*(*u*^,*v*^) as

$$p(\hat{u},\hat{v}) = \sum_{i=0}^{n}\sum_{j=0}^{m} B_i^n(\hat{u}) B_j^m(\hat{v}) R_{ij}$$

where *Rij* is a control point, *Bni*(*u*^) is the *i*th Bernstein polynomial of degree *n* (*uorder* = *n* + 1)

$$B_i^n(\hat{u}) = \binom{n}{i} \hat{u}^i (1-\hat{u})^{n-i}$$

and *Bmj*(*v*^) is the *j*th Bernstein polynomial of degree *m* (*vorder* = *m* + 1)

$$B_j^m(\hat{v}) = \binom{m}{j} \hat{v}^j (1-\hat{v})^{m-j}$$

Recall that

$$0^0 \equiv 1 \quad \text{and} \quad \binom{n}{0} \equiv 1$$

glMap2 is used to define the basis and to specify what kind of values are produced. Once defined, a map can be enabled and disabled by calling **glEnable** and **glDisable** with the map name, one of the nine predefined values for *target*, described below. When **glEvalCoord2** presents values *u* and *v*, the bivariate Bernstein polynomials are evaluated using *u*^ and *v*^, where

$$\hat{u} = \frac{u - u1}{u2 - u1}$$

$$\hat{v} = \frac{v - v1}{v2 - v1}$$

target is a symbolic constant that indicates what kind of control points are provided in *points*, and what output is generated when the map is evaluated. It can assume one of nine predefined values:

GL_MAP2_VERTEX_3
Each control point is three floating-point values representing *x*, *y*, and *z*. Internal **glVertex3** commands are generated when the map is evaluated.

GL_MAP2_VERTEX_4
Each control point is four floating-point values representing *x*, *y*, *z*, and *w*. Internal **glVertex4** commands are generated when the map is evaluated.

GL_MAP2_INDEX
Each control point is a single floating-point value representing a color index. Internal **glIndex** commands are generated when the map is evaluated. The current index is not updated with the value of these **glIndex** commands, however.

GL_MAP2_COLOR_4
Each control point is four floating-point values representing red, green, blue, and alpha. Internal **glColor4** commands are generated when the map is evaluated. The current color is not updated with the value of these **glColor4** commands however.

GL_MAP2_NORMAL
Each control point is three floating-point values representing the *x*, *y*, and *z* components of a normal vector. Internal **glNormal** commands are generated when the map is evaluated. The current normal is not updated with the value of these **glNormal** commands, however.

GL_MAP2_TEXTURE_COORD_1
Each control point is a single floating-point value representing the *s* texture coordinate. Internal **glTexCoord1** commands are generated when the map is evaluated. The current texture coordinates are not updated with the value of these **glTexCoord1** commands, however.

GL_MAP2_TEXTURE_COORD_2
Each control point is a single floating-point value representing the *s* and *t* texture coordinates. Internal **glTexCoord2** commands are generated when the map is evaluated. The current texture coordinates are not updated with the value of these **glTexCoord** commands, however.

GL_MAP2_TEXTURE_COORD_3
Each control point is a single floating-point value representing the *s*, *t* and *r* texture coordinates. Internal **glTexCoord3** commands are generated when the map is evaluated. The current texture coordinates are not updated with the value of these **glTexCoord** commands, however.

GL_MAP2_TEXTURE_COORD_4
Each control point is a single floating-point value representing the *s*, *t*, *r* and *q* texture coordinates. Internal **glTexCoord4** commands are generated when the map is evaluated. The current texture coordinates are not updated with the value of these **glTexCoord** commands, however.

ustride, *uorder*, *vstride*, *vorder*, and *points* define the array addressing for accessing the control points. *points* is the location of the first control point, which occupies one, two, three, or four contiguous memory locations, depending on which map is being defined. There are *uorder* * *vorder* control points in the array. *ustride* tells how many float or double locations are skipped to advance the internal memory pointer from control point Rij to control point $R(i+1)j$. *vstride* tells how many float or double locations are skipped to advance the internal memory pointer from control point Rij to control point $Ri(j+1)$.

NOTES

As is the case with all GL commands that accept pointers to data, it is as if the contents of *points* were copied by **glMap2** before it returned. Changes to the contents of *points* have no effect after **glMap2** is called.

ERRORS

GL_INVALID_ENUM is generated if *target* is not an accepted value.

GL_INVALID_VALUE is generated if *u1* is equal to *u2*, or if *v1* is equal to *v2*.

GL_INVALID_VALUE is generated if either *ustride* or *vstride* is less than the number of values in a control point.

GL_INVALID_VALUE is generated if either *uorder* or *vorder* is less than one or greater than **GL_MAX_VAL_ORDER**.

GL_INVALID_OPERATION is generated if **glMap2** is called between a call to **glBegin** and the corresponding call to **glEnd**.

glMatrixMode

NAME

glMatrixMode -- specify which matrix is the current matrix

C SPECIFICATION

```
void glMatrixMode(GLenum mode)
```

PARAMETERS

mode
: Specifies which matrix stack is the target for subsequent matrix operations. Three values are accepted: **GL_MODELVIEW**, **GL_PROJECTION**, and **GL_TEXTURE**. The default value is **GL_MODELVIEW**.

DESCRIPTION

glMatrixMode sets the current matrix mode. *mode* can assume one of three values:

GL_MODELVIEW
: Applies subsequent matrix operations to the modelview matrix stack.

GL_PROJECTION
: Applies subsequent matrix operations to the projection matrix stack.

GL_TEXTURE
: Applies subsequent matrix operations to the texture matrix stack.

ERRORS

GL_INVALID_ENUM is generated if *mode* is not an accepted value.

GL_INVALID_OPERATION is generated if **glMatrixMode** is called between a call to **glBegin** and the corresponding call to **glEnd**.

glMaterial

NAME

glMaterialf, **glMateriali**, **glMaterialfv**, **glMaterialiv** -- specify material parameters for the lighting model

C SPECIFICATION

```
void glMaterialf(GLenum face,
                 GLenum pname,
                 GLfloat para)
void glMateriali(GLenum face,
                 GLenum pname,
                 GLint para)
```

PARAMETERS

face
: Specifies which face or faces are being updated. Must be one of **GL_FRONT**, **GL_BACK**, or **GL_FRONT_AND_BACK**.

pname
: Specifies the single-valued material parameter of the face or faces that is being updated. Must be **GL_SHININESS**.

param
: Specifies the value that parameter **GL_SHININESS** will be set to.

C SPECIFICATION

```
void glMaterialfv(GLenum face,
                  GLenum pname,
                  const GLfloat *params)
void glMaterialiv(GLenum face,
                  GLenum pname,
                  const GLint *params)
```

PARAMETERS

face
: Specifies which face or faces are being updated. Must be one of **GL_FRONT**, **GL_BACK**, or **GL_FRONT_AND_BACK**.

pname
: Specifies the single-valued material parameter of the face or faces that is being updated. Must be one of **GL_AMBIENT**, **GL_DIFFUSE**, **GL_SPECULAR**, **GL_EMISSION**, **GL_SHININESS**, **GL_AMBIENT_AND_DIFFUSE**, or **GL_COLOR_INDEXES**.

param
: Specifies a pointer to the value or values that *pname* will be set to.

DESCRIPTION

glMaterial assigns values to material parameters. There are two matched sets of material parameters. One, the *front-*

facing set, is used to shade points, lines, bitmaps, and all polygons (when two-sided lighting is disabled), or just front-facing polygons (when two-sided lighting is enabled). The other set, *back-facing*, is used to shade back-facing polygons only when two-sided lighting is enabled. Refer to the **glLightModel** reference page for details concerning one- and two-sided lighting calculations.

glMaterial takes three arguments. The first, *face*, specifies whether the **GL_FRONT** materials, the **GL_BACK** materials, or both **GL_FRONT_AND_BACK** materials will be modified. The second, *pname*, specifies which of several parameters in one or both sets will be modified. The third, *params*, specifies what value or values will be assigned to the specified parameter.

Material parameters are used in the lighting equation that is optionally applied to each vertex. The equation is discussed in the **glLightModel** reference page. The parameters that can be specified using **glMaterial**, and their interpretations by the lighting equation, are as follows:

GL_AMBIENT
: *params* contains four integer or floating-point values that specify the ambient RGBA reflectance of the material. Integer values are mapped linearly such that the most positive representable value maps to 1.0, and the most negative representable value maps to -1.0. Floating-point values are mapped directly. Neither integer nor floating-point values are clamped. The default ambient reflectance for both front- and back-facing materials is (0.2, 0.2, 0.2, 1.0).

GL_DIFFUSE
: *params* contains four integer or floating-point values that specify the diffuse RGBA reflectance of the material. Integer values are mapped linearly such that the most positive representable value maps to 1.0, and the most negative representable value maps to -1.0. Floating-point values are mapped directly. Neither integer nor floating-point values are clamped. The default diffuse reflectance for both front- and back-facing materials is (0.8, 0.8, 0.8, 1.0).

GL_SPECULAR
: *params* contains four integer or floating-point values that specify the specular RGBA reflectance of the material. Integer values are mapped linearly such that the most positive representable value maps to 1.0, and the most negative representable value maps to -1.0. Floating-point values are mapped directly. Neither integer nor floating-point values are clamped. The default specular reflectance for both front- and back-facing materials is (0.0, 0.0, 0.0, 1.0).

GL_EMISSION
: *params* contains four integer or floating-point values that specify the RGBA emitted light intensity of the material. Integer values are mapped linearly such that the most positive representable value maps to 1.0, and the most negative representable value maps to -1.0. Floating-point values are mapped directly. Neither integer nor floating-point values are clamped. The default emission intensity for both front- and back-facing materials is (0.0, 0.0, 0.0, 1.0).

GL_SHININESS
: *params* is a single integer or floating-point value that specifies the RGBA specular exponent of the material. Integer and floating-point values are mapped directly. Only values in the range [0, 128] are accepted. The default specular exponent for both front- and back-facing materials is 0.

GL_AMBIENT_AND_DIFFUSE
: Equivalent to calling **glMaterial** twice with the same parameter values, once with **GL_AMBIENT** and once with **GL_DIFFUSE**.

GL_COLOR_INDEXES
: *params* contains three integer or floating-point values specifying the color indices for ambient, diffuse, and specular lighting. These three values, and **GL_SHININESS**, are the only material values used by the color index mode lighting equation. Refer to the **glLightModel** reference page for a discussion of color index lighting.

NOTES

The material parameters can be updated at any time. In particular, **glMaterial** can be called between a call to **glBegin** and the corresponding call to **glEnd**. If only a single material parameter is to be changed per vertex, however, **glColorMaterial** is preferred over **glMaterial** (see **glColorMaterial**).

ERRORS

GL_INVALID_ENUM is generated if either *face* or *pname* is not an accepted value.

GL_INVALID_VALUE is generated if a specular exponent outside the range [0, 128] is specified.

glNewList, glEndList

NAME

glNewList, **glEndList** -- create or replace a display list

C SPECIFICATION

```
void glNewList(GLuint list,
               GLenum mode)
```

PARAMETERS

list
Specifies the display list name.

mode
Specifies the compilation mode, which can be **GL_COMPILE** or **GL_COMPILE_AND_EXECUTE**.

C SPECIFICATION

```
void glEndList(void void)
```

DESCRIPTION

Display lists are groups of GL commands that have been stored for subsequent execution. The display lists are created with **glNewList**. All subsequent commands are placed in the display list, in the order issued, until **glEndList** is called.

glNewList has two arguments. The first argument, *list*, is a positive integer that becomes the unique name for the display list. Names can be created and reserved with **glGenLists** and tested for uniqueness with **glIsList**. The second argument, *mode*, is a symbolic constant that can assume one of two values:

GL_COMPILE
Commands are merely compiled.

GL_COMPILE_AND_EXECUTE
Commands are executed as they are compiled into the display list.

Certain commands are not compiled into the display list, but are executed immediately, regardless of the display-list mode. These commands are **glIsList**, **glGenLists**, **glDeleteList**, **glFeedbackBuffer**, **glSelectBuffer**, **glRenderMode**, **glReadPixels**, **glPixelStore**, **glFlush**, **glFinish**, **glIsEnabled**, and all of the **glGet** routines.

When **glEndList** is encountered, the display-list definition is completed by associating the list with the unique name list (specified in the **glNewList** command). If a display list with name list already exists, it is replaced only when **glEndList** is called.

NOTES

glCallList and **glCallLists** can be entered into display lists. The commands in the display list or lists executed by **glCallList** or **glCallLists** are not included in the display list being created, even if the list creation mode is **GL_COMPILE_AND_EXECUTE**.

ERRORS

GL_INVALID_VALUE is generated if *list* is zero.

GL_INVALID_ENUM is generated if *mode* is not an accepted value.

GL_INVALID_OPERATION is generated if **glEndList** is called without a preceding **glNewList**, or if **glNewList** is called while a display list is being defined.

GL_INVALID_OPERATION is generated if **glNewList** is called between a call to **glBegin** and the corresponding call to **glEnd**.

ASSOCIATED GETS

glMultMatrix

NAME

glMultMatrixd, **glMultMatrixf** -- multiply the current matrix by an arbitrary matrix

C SPECIFICATION

```
void glMultMatrixd(const GLdouble *m)
void glMultMatrixf(const GLfloat *m)
```

PARAMETERS

m
: Specifies a pointer a to 4*4 matrix stored in column-major order as sixteen consecutive values.

DESCRIPTION

glMultMatrix multiplies the current matrix with the one specified in *m*. That is, if M is the current matrix and T is the matrix passed to **glMultMatrix**, then M is replaced with M * T.

The current matrix is the projection matrix, modelview matrix, or texture matrix, determined by the current matrix mode (see **glMatrixMode**).

m points to a 4*4 matrix of single- or double-precision floating-point values stored in column-major order. That is, the matrix is stored as

$$\begin{pmatrix} a_0 & a_4 & a_8 & a_{12} \\ a_1 & a_5 & a_9 & a_{13} \\ a_2 & a_6 & a_{10} & a_{14} \\ a_3 & a_7 & a_{11} & a_{15} \end{pmatrix}$$

ERRORS

GL_INVALID_OPERATION is generated if **glMultMatrix** is executed between the execution of **glBegin** and the corresponding execution of **glEnd**.

ASSOCIATED GETS

glOrtho

NAME

glOrtho -- multiply the current matrix by an orthographic matrix

C SPECIFICATION

```
void glOrtho(GLdouble left,
             GLdouble right,
             GLdouble bottom,
             GLdouble top,
             GLdouble near,
             GLdouble far)
```

PARAMETERS

left, *right*
: Specify the coordinates for the left and right vertical clipping planes.

bottom, *top*
: Specify the coordinates for the bottom and top horizontal clipping planes.

near, *far*
: Specify the distances to the nearer and farther depth clipping planes. These distances are negative if the plane is to be behind the viewer.

DESCRIPTION

glOrtho describes a matrix that produces a parallel projection. (*left*, *bottom*, -*near*) and (*right*, *top*, -*near*) specify the points on the near clipping plane that are mapped to the lower left and upper right corners of the window, respectively, assuming that the eye is located at (0, 0, 0). -*far* specifies the location of the far clipping plane. Both *near* and *far* can be either positive or negative. The corresponding matrix is

$$\begin{pmatrix} \frac{2}{right-left} & 0 & 0 & t_x \\ 0 & \frac{2}{top-bottom} & 0 & t_y \\ 0 & 0 & \frac{-2}{far-near} & t_z \\ 0 & 0 & 0 & 1 \end{pmatrix}$$

where

$$t_x = \frac{right+left}{right-left}$$
$$t_y = \frac{top+bottom}{top-bottom}$$
$$t_z = \frac{far+near}{far-near}$$

The current matrix is multiplied by this matrix with the result replacing the current matrix. That is, if M is the current matrix and O is the ortho matrix, then M is replaced with M*O.

Use **glPushMatrix** and **glPopMatrix** to save and restore the current matrix stack.

ERRORS

GL_INVALID_OPERATION is generated if **glOrtho** is called between a call to **glBegin** and the corresponding call to **glEnd**.

                GLfloat nz)
void glNormal3i(GLint nx,
                GLint ny,
                GLint nz)
void glNormal3s(GLshort nx,
                GLshort ny,
                GLshort nz)
```

PARAMETERS

nx, *ny*, *nz*
: Specify the *x*, *y*, and *z* coordinates of the new current normal. The initial value of the current normal is (0, 0, 1).

C SPECIFICATION

```
void glNormal3bv(const GLbyte *v),
void glNormal3dv(const GLdouble *v),
void glNormal3fv(const GLfloat *v),
void glNormal3iv(const GLint *v),
void glNormal3sv(const GLshort *v),
```

PARAMETERS

v
: Specifies a pointer to an array of three elements: the *x*, *y*, and *z* coordinates of the new current normal.

DESCRIPTION

The current normal is set to the given coordinates whenever **glNormal** is issued. Byte, short, or integer arguments are converted to floating-point format with a linear mapping that maps the most positive representable integer value to 1.0, and the most negative representable integer value to -1.0.

Normals specified with **glNormal** need not have unit length. If normalization is enabled, then normals specified with **glNormal** are normalized after transformation. Normalization is controlled using **glEnable** and **glDisable** with the argument **GL_NORMALIZE**. By default, normalization is disabled.

NOTES

The current normal can be updated at any time. In particular, **glNormal** can be called between a call to **glBegin** and the corresponding call to **glEnd**.

ASSOCIATED GETS

glGet with argument **GL_CURRENT_NORMAL**
glIsEnabled with argument **GL_NORMALIZE**

glPixelMap

NAME

glPixelMapfv, **glPixelMapuiv**, **glPixelMapusv** -- set up pixel transfer maps

C SPECIFICATION

```
void glPixelMapfv(GLenum map,
                  GLint mapsize,
                  const GLfloat *values)
void glPixelMapuiv(GLenum map,
                   GLint mapsize,
                   const GLuint *values)
void glPixelMapusv(GLenum map,
                   GLint mapsize,
                   const GLushort *values)
```

PARAMETERS

map
: Specifies a symbolic map name. Must be one of the following: **GL_PIXEL_MAP_I_TO_I**, **GL_PIXEL_MAP_S_TO_S**, **GL_PIXEL_MAP_I_TO_R**, **GL_PIXEL_MAP_I_TO_G**, **GL_PIXEL_MAP_I_TO_B**, **GL_PIXEL_MAP_I_TO_A**, **GL_PIXEL_MAP_R_TO_R**, **GL_PIXEL_MAP_G_TO_G**, **GL_PIXEL_MAP_B_TO_B**, or **GL_PIXEL_MAP_A_TO_A**.

mapsize
: Specifies the size of the map being defined.

values
: Specifies an array of *mapsize* values.

DESCRIPTION

glPixelMap sets up translation tables, or maps, used by **glDrawPixels**, **glReadPixels**, **glCopyPixels**, **glTexImage1D**, and **glTexImage2D**. Use of these maps is described completely in the **glPixelTransfer** reference page, and partly in the reference pages for the pixel and texture image commands. Only the specification of the maps is described in this reference page.

map is a symbolic map name, indicating one of ten maps to set. *mapsize* specifies the number of entries in the map, and *values* is a pointer to an array of *mapsize* map values.

The ten maps are as follows:

GL_PIXEL_MAP_I_TO_I
: Maps color indices to color indices.

GL_PIXEL_MAP_S_TO_S
: Maps stencil indices to stencil indices.

GL_PIXEL_MAP_I_TO_R
: Maps color indices to red components.

GL_PIXEL_MAP_I_TO_G
: Maps color indices to green components.

GL_PIXEL_MAP_I_TO_B
Maps color indices to blue components.

GL_PIXEL_MAP_I_TO_A
Maps color indices to alpha components.

GL_PIXEL_MAP_R_TO_R
Maps red components to red components.

GL_PIXEL_MAP_G_TO_G
Maps green components to green components.

GL_PIXEL_MAP_B_TO_B
Maps blue components to blue components.

GL_PIXEL_MAP_A_TO_A
Maps alpha components to alpha components.

The entries in a map can be specified as single-precision floating-point numbers, unsigned short integers, or unsigned long integers. Maps that store color component values (all but **GL_PIXEL_MAP_I_TO_I** and **GL_PIXEL_MAP_S_TO_S**) retain their values in floating-point format, with unspecified mantissa and exponent sizes. Floating-point values specified by **glPixelMapfv** are converted directly to the internal floating-point format of these maps, then clamped to the range [0, 1]. Unsigned integer values specified by **glPixelMapusv** and **glPixelMapuiv** are converted linearly such that the largest representable integer maps to 1.0, and zero maps to 0.0.

Maps that store indices, **GL_PIXEL_MAP_I_TO_I** and **GL_PIXEL_MAP_S_TO_S**, retain their values in fixed-point format, with an unspecified number of bits to the right of the binary point. Floating-point values specified by **glPixelMapfv** are converted directly to the internal fixed-point format of these maps. Unsigned integer values specified by **glPixelMapusv** and **glPixelMapuiv** specify integer values, with all zeros to the right of the binary point.

The table below shows the initial sizes and values for each of the maps. Maps that are indexed by either color or stencil indices must have *mapsize* = 2^*n* for some *n* or results are undefined. The maximum allowable size for each map depends on the implementation and can be determined by calling glGet with argument **GL_MAX_PIXEL_MAP_TABLE**. The single maximum applies to all maps, and it is at least 32.

map	*lookup index*	*lookup value*	*initial size*	*initial value*
GL_PIXEL_MAP_I_TO_I	color index	color index	1	0.0
GL_PIXEL_MAP_S_TO_S	stencil index	stencil index	1	0
GL_PIXEL_MAP_I_TO_R	color index	R	1	0.0
GL_PIXEL_MAP_I_TO_G	color index	G	1	0.0
GL_PIXEL_MAP_I_TO_B	color index	B	1	0.0
GL_PIXEL_MAP_I_TO_A	color index	A	1	0.0
GL_PIXEL_MAP_R_TO_R	R	R	1	0.0
GL_PIXEL_MAP_G_TO_G	G	G	1	0.0
GL_PIXEL_MAP_B_TO_B	B	B	1	0.0
GL_PIXEL_MAP_A_TO_A	A	A	1	0.0

ERRORS

GL_INVALID_ENUM is generated if *map* is not an accepted value.

GL_INVALID_VALUE is generated if *mapsize* is negative or larger than **GL_MAX_PIXEL_MAP_TABLE**.

GL_INVALID_VALUE is generated if *map* is **GL_PIXEL_MAP_I_TO_I**, **GL_PIXEL_MAP_S_TO_S**,

GL_PIXEL_MAP_I_TO_R, **GL_PIXEL_MAP_I_TO_G**, **GL_PIXEL_MAP_I_TO_B**, or **GL_PIXEL_MAP_I_TO_A**, and *mapsize* is not a power of two.

GL_INVALID_OPERATION is generated if **glPixelMap** is called between a call to **glBegin** and the corresponding call to **glEnd**.

glPassThrough

NAME

glPassThrough -- place a marker in the feedback buffer

C SPECIFICATION

`void glPassThrough(GLfloat token)`

PARAMETERS

token
Specifies a marker value to be placed in the feedback buffer following a **GL_PASS_THROUGH_TOKEN**.

DESCRIPTION

Feedback is a GL render mode. The mode is selected by calling **glRenderMode** with **GL_FEEDBACK**. When the GL is in feedback mode, no pixels are produced by rasterization. Instead, information about primitives that would have been rasterized is fed back to the application using the GL. See **glFeedbackBuffer** for a description of the feedback buffer and the values in it.

glPassThrough inserts a user-defined marker in the feedback buffer when it is executed in feedback mode. *token* is returned as if it were a primitive; it is indicated with its own unique identifying value: **GL_PASS_THROUGH_TOKEN**. The order of **glPassThrough** commands with respect to the specification of graphics primitives is maintained.

NOTES

glPassThrough is ignored if the GL is not in feedback mode.

ERRORS

GL_INVALID_OPERATION is generated if **glPassThrough** is called between a call to **glBegin** and the corresponding call to **glEnd**.

ASSOCIATED GETS

glGet with argument **GL_RENDER_MODE**

glPixelTransfer

NAME

glPixelTransferf, **glPixelTransferi** -- set pixel transfer modes

C SPECIFICATION

```
void glPixelTransferf(GLenum pname,
                      GLfloat param)
void glPixelTransferi(GLenum pname,
                      GLint param)
```

PARAMETERS

pname
: Specifies the symbolic name of the pixel transfer parameter to be set. Must be one of the following: **GL_MAP_COLOR**, **GL_MAP_STENCIL**, **GL_INDEX_SHIFT**, **GL_INDEX_OFFSET**, **GL_RED_SCALE**, **GL_RED_BIAS**, **GL_GREEN_SCALE**, **GL_GREEN_BIAS**, **GL_BLUE_SCALE**, **GL_BLUE_BIAS**, **GL_ALPHA_SCALE**, **GL_ALPHA_BIAS**, **GL_DEPTH_SCALE**, or **GL_DEPTH_BIAS**.

param
: Specifies the value that *pname is set to.*

DESCRIPTION

glPixelTransfer *sets pixel transfer modes that affect the operation of subsequent **glDrawPixels**, **glReadPixels**, **glCopyPixels**, **glTexImage1D**, and **glTexImage2D** commands. The algorithms that are specified by pixel transfer modes operate on pixels after they are read from the frame buffer (**glReadPixels** and **glCopyPixels**) or unpacked from client memory (**glDrawPixels**, **glTexImage1D**, and **glTexImage2D**). Pixel transfer operations happen in the same order, and in the same manner, regardless of the command that resulted in the pixel operation. Pixel storage modes (see **glPixelStore**) control the unpacking of pixels being read from client memory, and the packing of pixels being written back into client memory.*

Pixel transfer operations handle four fundamental pixel types: color, color index, depth, and stencil. Color pixels are made up of four floating-point values with unspecified mantissa and exponent sizes, scaled such that 0.0 represents zero intensity and 1.0 represents full intensity. Color indices comprise a single fixed-point value, with unspecified precision to the right of the binary point. Depth pixels comprise a single floating-point value, with unspecified mantissa and exponent sizes, scaled such that 0.0 represents the minimum depth buffer value, and 1.0 represents the maximum depth buffer value. Finally, stencil pixels comprise a single fixed-point value, with unspecified precision to the right of the binary point.

The pixel transfer operations performed on the four basic pixel types are as follows:

Color
: *Each of the four color components is multiplied by a scale factor, then added to a bias factor. That is, the red component is multiplied by **GL_RED_SCALE**, then added to **GL_RED_BIAS**; the green component is multiplied by **GL_GREEN_SCALE**, then added to **GL_GREEN_BIAS**; the blue component is multiplied by **GL_BLUE_SCALE**, then added to **GL_BLUE_BIAS**; and the alpha component is multiplied by **GL_ALPHA_SCALE**, then added to **GL_ALPHA_BIAS**. After all four color components are scaled and biased, each is clamped to the range [0, 1]. All color scale and bias values are specified with **glPixelTransfer**.*

*If **GL_MAP_COLOR** is true, each color component is scaled by the size of the corresponding color-to-color map, then replaced by the contents of that map indexed by the scaled component. That is, the red component is scaled by **GL_PIXEL_MAP_R_TO_R_SIZE**, then replaced by the contents of **GL_PIXEL_MAP_R_TO_R** indexed by itself. The green component is scaled by **GL_PIXEL_MAP_G_TO_G_SIZE**, then replaced by the contents of **GL_PIXEL_MAP_G_TO_G** indexed by itself. The blue component is scaled by **GL_PIXEL_MAP_B_TO_B_SIZE**, then replaced by the contents of **GL_PIXEL_MAP_B_TO_B** indexed by itself. And the alpha component is scaled by **GL_PIXEL_MAP_A_TO_A_SIZE**, then replaced by the contents of **GL_PIXEL_MAP_A_TO_A** indexed by itself. All components taken from the maps are then clamped to the range [0, 1]. **GL_MAP_COLOR** is specified with **glPixelTransfer**. The contents of the various maps are specified with **glPixelMap**.*

Color index

*Each color index is shifted left by **GL_INDEX_SHIFT** bits, filling with zeros any bits beyond the number of fraction bits carried by the fixed-point index. If **GL_INDEX_SHIFT** is negative, the shift is to the right, again zero filled. Then **GL_INDEX_OFFSET** is added to the index. **GL_INDEX_SHIFT** and **GL_INDEX_OFFSET** are specified with **glPixelTransfer**.*

*From this point, operation diverges depending on the required format of the resulting pixels. If the resulting pixels are to be written to a color index buffer, or if they are being read back to client memory in **GL_COLOR_INDEX** format, the pixels continue to be treated as indices. If **GL_MAP_COLOR** is true, each index is masked by 2^n - 1, where n is **GL_PIXEL_MAP_I_TO_I_SIZE**, then replaced by the contents of **GL_PIXEL_MAP_I_TO_I** indexed by the masked value. **GL_MAP_COLOR** is specified with **glPixelTransfer**. The contents of the index map are specified with **glPixelMap**.*

*If the resulting pixels are to be written to an RGBA color buffer, or if they are being read back to client memory in a format other than **GL_COLOR_INDEX**, the pixels are converted from indices to colors by referencing the four maps **GL_PIXEL_MAP_I_TO_R**, **GL_PIXEL_MAP_I_TO_G**, **GL_PIXEL_MAP_I_TO_B**, and **GL_PIXEL_MAP_I_TO_A**. Before being dereferenced, the index is masked by 2^n - 1, where n is **GL_PIXEL_MAP_I_TO_R_SIZE** for the red map, **GL_PIXEL_MAP_I_TO_G_SIZE** for the green map, **GL_PIXEL_MAP_I_TO_B_SIZE** for the blue map, and **GL_PIXEL_MAP_I_TO_A_SIZE** for the alpha map. All components taken from the maps are then clamped to the range [0, 1]. The contents of the four maps are specified with **glPixelMap**.*

Depth

*Each depth value is multiplied by **GL_DEPTH_SCALE**, added to **GL_DEPTH_BIAS**, then clamped to the range [0, 1].*

Stencil

*Each index is shifted **GL_INDEX_SHIFT** bits just as a color index is, then added to **GL_INDEX_OFFSET**. If **GL_MAP_STENCIL** is true, each index is masked by 2^n - 1, where n is **GL_PIXEL_MAP_S_TO_S_SIZE**, then replaced by the contents of **GL_PIXEL_MAP_S_TO_S** indexed by the masked value.*

*The following table gives the type, initial value, and range of valid values for each of the pixel transfer parameters that are set with **glPixelTransfer**.*

pname	*type*	*initial value*	*valid range*
GL_MAP_COLOR	Boolean	false	true/false
GL_MAP_STENCIL	Boolean	false	true/false
GL_INDEX_SHIFT	integer	0	$(-\infty, \infty)$
GL_INDEX_OFFSET	integer	0	$(-\infty, \infty)$
GL_RED_SCALE	float	1.0	$(-\infty, \infty)$
GL_GREEN_SCALE	float	1.0	$(-\infty, \infty)$
GL_BLUE_SCALE	float	1.0	$(-\infty, \infty)$
GL_ALPHA_SCALE	float	1.0	$(-\infty, \infty)$
GL_DEPTH_SCALE	float	1.0	$(-\infty, \infty)$
GL_RED_BIAS	float	0.0	$(-\infty, \infty)$
GL_GREEN_BIAS	float	0.0	$(-\infty, \infty)$
GL_BLUE_BIAS	float	0.0	$(-\infty, \infty)$
GL_ALPHA_BIAS	float	0.0	$(-\infty, \infty)$
GL_DEPTH_BIAS	float	0.0	$(-\infty, \infty)$

glPixelTransferf *can be used to set any pixel transfer parameter. If the parameter type is Boolean, 0.0 implies false and any other value implies true. If pname is an integer parameter, param is rounded to the nearest integer.*

Likewise, ***glPixelTransferi*** *can also be used to set any of the pixel transfer parameters. Boolean parameters are set to false if param is 0 and true otherwise. param is converted to floating point before being assigned to real-valued parameters.*

NOTES

If a ***glDrawPixels****,* ***glReadPixels****,* ***glCopyPixels****,* ***glTexImage1D****, or* ***glTexImage2D*** *command is placed in a display list (see* ***glNewList*** *and* ***glCallList****), the pixel transfer mode settings in effect when the display list is executed are the ones that are used. They may be different from the settings when the command was compiled into the display list.*

ERRORS

GL_INVALID_ENUM *is generated if pname is not an accepted value.*

GL_INVALID_OPERATION *is generated if* ***glPixelTransfer*** *is called between a call to* ***glBegin*** *and the corresponding call to* ***glEnd****.*

glPixelStore

NAME

glPixelStoref, **glPixelStorei** -- set pixel storage modes

C SPECIFICATION

```
void glPixelStoref(GLenum pname,
                   GLfloat param)
void glPixelStorei(GLenum pname,
                   GLint param)
```

PARAMETERS

pname
: Specifies the symbolic name of the parameter to be set. Six values affect the packing of pixel data into memory: **GL_PACK_SWAP_BYTES**, **GL_PACK_LSB_FIRST**, **GL_PACK_ROW_LENGTH**, **GL_PACK_SKIP_PIXELS**, **GL_PACK_SKIP_ROWS**, and **GL_PACK_ALIGNMENT**. Six more affect the unpacking of pixel data *from* memory: **GL_UNPACK_SWAP_BYTES**, **GL_UNPACK_LSB_FIRST**, **GL_UNPACK_ROW_LENGTH**, **GL_UNPACK_SKIP_PIXELS**, **GL_UNPACK_SKIP_ROWS**, and **GL_UNPACK_ALIGNMENT**.

param
: Specifies the value that pname is set to.

DESCRIPTION

glPixelStore sets pixel storage modes that affect the operation of subsequent **glDrawPixels** and **glReadPixels** as well as the unpacking of polygon stipple patterns (see **glPolygonStipple**), bitmaps (see **glBitmap**), and texture patterns (see **glTexImage1D**, and **glTexImage2D**).

pname is a symbolic constant indicating the parameter to be set, and *param* is the new value. Six of the twelve storage parameters affect how pixel data is returned to client memory, and are therefore significant only for **glReadPixels** or **glGetTexImage** commands. They are as follows:

GL_PACK_SWAP_BYTES
: If true, byte ordering for multibyte color components, depth components, color indices, or stencil indices is reversed. That is, if a four-byte component is made up of bytes $b0$, $b1$, $b2$, $b3$, it is stored in memory as $b3$, $b2$, $b1$, $b0$ if **GL_PACK_SWAP_BYTES** is true. **GL_PACK_SWAP_BYTES** has no effect on the memory order of components within a pixel, only on the order of bytes within components or indices. For example, the three components of a **GL_RGB** format pixel are always stored with red first, green second, and blue third, regardless of the value of **GL_PACK_SWAP_BYTES**.

GL_PACK_LSB_FIRST
: If true, bits are ordered within a byte from least significant to most significant; otherwise, the first bit in each byte is the most significant one. This parameter is significant for bitmap data only.

GL_PACK_ROW_LENGTH
: If greater than zero, **GL_PACK_ROW_LENGTH** defines the number of pixels in a row. If the first pixel of a row is placed at location *p* in memory, then the location of the first pixel of the next row is obtained by skipping

$$k = \begin{cases} nl & s \geq a \\ \frac{a}{s}\lceil \frac{snl}{a} \rceil & s < a \end{cases}$$

components or indices, where *n* is the number of components or indices in a pixel, *l* is the number of pixels in a row (**GL_PACK_ROW_LENGTH** if it is greater than zero, the width argument to the pixel routine otherwise), *a* is the value of **GL_PACK_ALIGNMENT**, and *s* is the size, in bytes, of a single component (if a < s, then it is as if a = s). In the case of 1-bit values, the location of the next row is obtained by skipping

$$k = 8a\lceil \frac{nl}{8a} \rceil$$

components or indices.

The word *component* in this description refers to the nonindex values red, green, blue, alpha, and depth. Storage format **GL_RGB**, for example, has three components per pixel: first red, then green, and finally blue.

GL_PACK_SKIP_PIXELS and **GL_PACK_SKIP_ROWS**

These values are provided as a convenience to the programmer; they provide no functionality that cannot be duplicated simply by incrementing the pointer passed to **glReadPixels**. Setting **GL_PACK_SKIP_PIXELS** to *i* is equivalent to incrementing the pointer by *i**n* components or indices, where *n* is the number of components or indices in each pixel. Setting **GL_PACK_SKIP_ROWS** to *j* is equivalent to incrementing the pointer by *j**k* components or indices, where *k* is the number of components or indices per row, as computed above in the **GL_PACK_ROW_LENGTH** section.

GL_PACK_ALIGNMENT

Specifies the alignment requirements for the start of each pixel row in memory. The allowable values are 1 (byte-alignment), 2 (rows aligned to even-numbered bytes), 4 (word alignment), and 8 (rows start on double-word boundaries).

The other six of these twelve storage parameters affect how pixel data is read from client memory. These values are significant for **glDrawPixels**, **glTexImage1D**, **glTexImage2D**, **glBitmap**, and **glPolygonStipple**. They are as follows:

GL_UNPACK_SWAP_BYTES

If true, byte ordering for multibyte color components, depth components, color indices, or stencil indices is reversed. That is, if a four-byte component is made up of bytes *b*0, *b*1, *b*2, *b*3, it is taken from memory as *b*3, *b*2, *b*1, *b*0 if **GL_UNPACK_SWAP_BYTES** is true. **GL_UNPACK_SWAP_BYTES** has no effect on the memory order of components within a pixel, only on the order of bytes within components or indices. For example, the three components of a **GL_RGB** format pixel are always stored with red first, green second, and blue third, regardless of the value of **GL_UNPACK_SWAP_BYTES**.

GL_UNPACK_LSB_FIRST

If true, bits are ordered within a byte from least significant to most significant; otherwise, the first bit in each byte is the most significant one. This parameter is significant for bitmap data only.

GL_UNPACK_ROW_LENGTH

If greater than zero, **GL_UNPACK_ROW_LENGTH** defines the number of pixels in a row. If the first pixel of a row is placed at location *p* in memory, then the location of the first pixel of the next row is obtained by skipping

$$k = \begin{cases} nl & s \geq a \\ \frac{a}{s}\lceil \frac{snl}{a} \rceil & s < a \end{cases}$$

components or indices, where *n* is the number of components or indices in a pixel, *l* is the number of pixels in a row (**GL_UNPACK_ROW_LENGTH** if it is greater than zero, the width argument to the pixel routine otherwise), *a* is the value of **GL_UNPACK_ALIGNMENT**, and *s* is the size, in bytes, of a single component (if a < s, then it is as if a = s). In the case of 1-bit values, the location of the next row is obtained by skipping

$$k = 8a\lceil \frac{nl}{8a} \rceil$$

components or indices.

The word *component* in this description refers to the nonindex values red, green, blue, alpha, and depth. Storage format **GL_RGB**, for example, has three components per pixel: first red, then green, and finally blue.

GL_PACK_SKIP_PIXELS and **GL_PACK_SKIP_ROWS**

These values are provided as a convenience to the programmer; they provide no functionality that cannot be duplicated simply by incrementing the pointer passed to **glDrawPixels**, **glTexImage1D**, **glTexImage2D**, **glBitmap**, or **glPolygonStipple**. Setting **GL_UNPACK_SKIP_PIXELS** to *i* is equivalent to incrementing the pointer by *i**n* components or indices, where *n* is the number of components or indices in each pixel. Setting **GL_UNPACK_SKIP_ROWS** to *j* is equivalent to incrementing the pointer by *j**k* components or indices, where *k* is the number of components or indices per row, as computed above in the **GL_UNPACK_ROW_LENGTH** section.

GL_UNPACK_ALIGNMENT

Specifies the alignment requirements for the start of each pixel row in memory. The allowable values are 1 (byte-alignment), 2 (rows aligned to even-numbered bytes), 4 (word alignment), and 8 (rows start on double-word boundaries).

The following table gives the type, initial value, and range of valid values for each of the storage parameters that can be set with **glPixelStore**.

pname	*type*	*initial value*	*valid range*
GL_PACK_SWAP_BYTES	Boolean	false	true or false
GL_PACK_LSB_FIRST	Boolean	false	true or false
GL_PACK_ROW_LENGTH	integer	0	$[0, \infty)$
GL_PACK_SKIP_ROWS	integer	0	$[0, \infty)$
GL_PACK_SKIP_PIXELS	integer	0	$[0, \infty)$
GL_PACK_ALIGNMENT	integer	4	1, 2, 4, or 8
GL_UNPACK_SWAP_BYTES	Boolean	false	true or false
GL_UNPACK_LSB_FIRST	Boolean	false	true or false
GL_UNPACK_ROW_LENGTH	integer	0	$[0, \infty)$
GL_UNPACK_SKIP_ROWS	integer	0	$[0, \infty)$
GL_UNPACK_SKIP_PIXELS	integer	0	$[0, \infty)$
GL_UNPACK_ALIGNMENT	integer	4	1, 2, 4, or 8

glPixelStoref can be used to set any pixel store parameter. If the parameter type is Boolean, then if *param* is 0.0, the parameter is false; otherwise it is set to true. If *pname* is a integer type parameter, *param* is rounded to the nearest integer.

Likewise, **glPixelStorei** can also be used to set any of the pixel store parameters. Boolean parameters are set to false if *param* is 0 and true otherwise. *param* is converted to floating point before being assigned to real-valued parameters.

NOTES

The pixel storage modes in effect when **glDrawPixels**, **glReadPixels**, **glTexImage1D**, **glTexImage2D**, **glBitmap**, or **glPolygonStipple** is placed in a display list control the interpretation of memory data. The pixel storage modes in effect when a display list is executed are not significant.

ERRORS

GL_INVALID_ENUM is generated if *pname* is not an accepted value.

GL_INVALID_VALUE is generated if a negative row length, pixel skip, or row skip value is specified, or if alignment is specified other than 1, 2, 4, or 8.

GL_INVALID_OPERATION is generated if **glPixelStore** is called between a call to **glBegin** and the corresponding call to **glEnd**.

glPointSize

NAME

glPointSize -- specify the diameter of rasterized points

C SPECIFICATION

```
void glPointSize(GLfloat size)
```

PARAMETERS

size
: Specifies the diameter of rasterized points. The default is 1.0.

DESCRIPTION

glPointSize specifies the rasterized diameter of both aliased and antialiased points. Using a point size other than 1.0 has different effects, depending on whether point antialiasing is enabled. Point antialiasing is controlled by calling **glEnable** and **glDisable** with argument **GL_POINT_SMOOTH**.

If point antialiasing is disabled, the actual size is determined by rounding the supplied size to the nearest integer. (If the rounding results in the value 0, it is as if the point size were 1.) If the rounded size is odd, then the center point (x, y) of the pixel fragment that represents the point is computed as

$$(\lfloor x_w \rfloor + 0.5, \lfloor y_w \rfloor + 0.5)$$

where *w* subscripts indicate window coordinates. All pixels that lie within the square grid of the rounded size centered at (x, y) make up the fragment. If the size is even, the center point is

$$(\lfloor x_w + 0.5 \rfloor, \lfloor y_w + 0.5 \rfloor)$$

and the rasterized fragment's centers are the half-integer window coordinates within the square of the rounded size centered at (x, y). All pixel fragments produced in rasterizing a nonantialiased point are assigned the same associated data, that of the vertex corresponding to the point.

If antialiasing is enabled, then point rasterization produces a fragment for each pixel square that intersects the region lying within the circle having diameter equal to the current point size and centered at the point's (xw, yw). The coverage value for each fragment is the window coordinate area of the intersection of the circular region with the corresponding pixel square. This value is saved and used in the final rasterization step. The data associated with each fragment is the data associated with the point being rasterized.

Not all sizes are supported when point antialiasing is enabled. If an unsupported size is requested, the nearest supported size is used. Only size 1.0 is guaranteed to be supported; others depend on the implementation. The range of supported sizes and the size difference between supported sizes within the range can be queried by calling **glGet** with arguments **GL_POINT_SIZE_RANGE** and **GL_POINT_SIZE_GRANULARITY**.

NOTES

The point size specified by **glPointSize** is always returned when **GL_POINT_SIZE** is queried. Clamping and rounding for aliased and antialiased points have no effect on the specified value.

Non-antialiased point size may be clamped to an implementation-dependent maximum. Although this maximum cannot be queried, it must be no less than the maximum value for antialiased points, rounded to the nearest integer value.

ERRORS

GL_INVALID_VALUE is generated if *size* is less than or equal to zero.

GL_INVALID_OPERATION is generated if **glPointSize** is called between a call to **glBegin** and the corresponding call to **glEnd**.

glPixelZoom

NAME

glPixelZoom -- specify the pixel zoom factors

C SPECIFICATION

```
void glPixelZoom(GLfloat xfactor,
                 GLfloat yfactor)
```

PARAMETERS

xfactor, *yfactor*
: Specify the x and y zoom factors for pixel write operations.

DESCRIPTION

glPixelZoom specifies values for the x and y zoom factors. During the execution of glDrawPixels or glCopyPixels, if (xr, yr) is the current raster position, and a given element is in the mth row and nth column of the pixel rectangle, then pixels whose centers are in the rectangle with corners at

$$(xr + n * xfactor, yr + m * yfactor)$$

$$(xr + (n + 1) * xfactor, yr + (m + 1) * yfactor)$$

are candidates for replacement. Any pixel whose center lies on the bottom or left edge of this rectangular region is also modified.

Pixel zoom factors are not limited to positive values. Negative zoom factors reflect the resulting image about the current raster position.

ERRORS

GL_INVALID_OPERATION is generated if **glPixelZoom** is called between a call to **glBegin** and the corresponding call to **glEnd**.

glPolygonStipple

NAME

glPolygonStipple -- set the polygon stippling pattern

C SPECIFICATION

```
void glPolygonStipple(const GLubyte *mask)
```

PARAMETERS

mask
: Specifies a pointer to a 32*32 stipple pattern that will be unpacked from memory in the same way that **glDrawPixels** unpacks pixels.

DESCRIPTION

Polygon stippling, like line stippling (see **glLineStipple**), masks out certain fragments produced by rasterization, creating a pattern. Stippling is independent of polygon antialiasing.

mask is a pointer to a 32*32 stipple pattern that is stored in memory just like the pixel data supplied to a **glDrawPixels** with *height* and *width* both equal to 32, a pixel format of **GL_COLOR_INDEX**, and data type of **GL_BITMAP**. That is, the stipple pattern is represented as a 32*32 array of 1-bit color indices packed in unsigned bytes. **glPixelStore** parameters like **GL_UNPACK_SWAP_BYTES** and **GL_UNPACK_LSB_FIRST** affect the assembling of the bits into a stipple pattern. Pixel transfer operations (shift, offset, pixel map) are not applied to the stipple image, however.

Polygon stippling is enabled and disabled with **glEnable** and **glDisable**, using argument **GL_POLYGON_STIPPLE**. If enabled, a rasterized polygon fragment with window coordinates *xw* and *yw* is sent to the next stage of the GL if and only if the (*xw* mod 32)th bit in the (*yw* mod 32)th row of the stipple pattern is one. When polygon stippling is disabled, it is as if the stipple pattern were all ones.

ERRORS

GL_INVALID_OPERATION is generated if **glPolygonStipple** is called between a call to **glBegin** and the corresponding call to **glEnd**.

ASSOCIATED GETS

glPolygonMode

NAME

glPolygonMode -- select a polygon rasterization mode

C SPECIFICATION

```
void glPolygonMode(GLenum face,
                   GLenum mode)
```

PARAMETERS

face
: Specifies the polygons that *mode* applies to. Must be **GL_FRONT** for front-facing polygons, **GL_BACK** for back-facing polygons, or **GL_FRONT_AND_BACK** for front- and back-facing polygons.

mode
: Specifies the way polygons will be rasterized. Accepted values are **GL_POINT**, **GL_LINE**, and **GL_FILL**. The default is **GL_FILL** for both front- and back-facing polygons.

DESCRIPTION

glPolygonMode controls the interpretation of polygons for rasterization. *face* describes which polygons mode applies to: front-facing polygons (**GL_FRONT**), back-facing polygons (**GL_BACK**), or both (**GL_FRONT_AND_BACK**). The polygon mode affects only the final rasterization of polygons. In particular, a polygon's vertices are lit and the polygon is clipped and possibly culled before these modes are applied.

Three modes are defined and can be specified in *mode*:

GL_POINT
: Polygon vertices that are marked as the start of a boundary edge are drawn as points. Point attributes such as **GL_POINT_SIZE** and **GL_POINT_SMOOTH** control the rasterization of the points. Polygon rasterization attributes other than **GL_POLYGON_MODE** have no effect.

GL_LINE
: Boundary edges of the polygon are drawn as line segments. They are treated as connected line segments for line stippling; the line stipple counter and pattern are not reset between segments (see **glLineStipple**). Line attributes such as **GL_LINE_WIDTH** and **GL_LINE_SMOOTH** control the rasterization of the lines. Polygon rasterization attributes other than **GL_POLYGON_MODE** have no effect.

GL_FILL
: The interior of the polygon is filled. Polygon attributes such as **GL_POLYGON_STIPPLE** and **GL_POLYGON_SMOOTH** control the rasterization of the polygon.

EXAMPLES

To draw a surface with filled back-facing polygons and outlined front-facing polygons, call

```
glPolygonMode(GL_FRONT, GL_LINE);
```

NOTES

Vertices are marked as boundary or nonboundary with an edge flag. Edge flags are generated internally by the GL when it decomposes polygons, and they can be set explicitly using **glEdgeFlag**.

ERRORS

GL_INVALID_ENUM is generated if either *face* or *mode*is not an accepted value.

GL_INVALID_OPERATION is generated if **glPolygonMode** is called between a call to **glBegin** and the corresponding call to **glEnd**.

ASSOCIATED GETS

glGet with argument **GL_POLYGON_MODE**

glPushMatrix, glPopMatrix

NAME

glPushMatrix, **glPopMatrix** -- push and pop the current matrix stack

C SPECIFICATION

```
void glPushMatrix(void void)
```

C SPECIFICATION

```
void glPopMatrix(void void)
```

DESCRIPTION

There is a stack of matrices for each of the matrix modes. In **GL_MODELVIEW** mode, the stack depth is at least 32. In the other two modes, **GL_PROJECTION** and **GL_TEXTURE**, the depth is at least 2. The current matrix in any mode is the matrix on the top of the stack for that mode.

glPushMatrix pushes the current matrix stack down by one, duplicating the current matrix. That is, after a **glPushMatrix** call, the matrix on the top of the stack is identical to the one below it.

glPopMatrix pops the current matrix stack, replacing the current matrix with the one below it on the stack.

Initially, each of the stacks contains one matrix, an identity matrix.

It is an error to push a full matrix stack, or to pop a matrix stack that contains only a single matrix. In either case, the error flag is set and no other change is made to GL state.

ERRORS

GL_STACK_OVERFLOW is generated if **glPushMatrix** is called while the current matrix stack is full.

GL_STACK_UNDERFLOW is generated if **glPopAttrib** is called while the current matrix stack contains only a single matrix.

GL_INVALID_OPERATION is generated if **glPushMatrix** is called between a call to **glBegin** and the corresponding call to **glEnd**.

glPushAttrib, glPopAttrib

NAME

glPushAttrib, **glPopAttrib** -- push and pop the attribute stack

C SPECIFICATION

```
void glPushAttrib(GLbitfield mask)
```

PARAMETERS

mask
Specifies a mask that indicates which attributes to save. Values for *mask* are listed in the table below.

C SPECIFICATION

```
void glPopAttrib(void void)
```

DESCRIPTION

glPushAttrib takes one argument, a mask that indicates which groups of state variables to save on the attribute stack. Symbolic constants are used to set bits in the mask. *mask* is typically constructed by ORing several of these constants together. The special mask **GL_ALL_ATTRIB_BITS** can be used to save all stackable states.

The symbolic *mask* constants and their associated GL state are as follows (the second column lists which attributes are saved):

GL_ACCUM_BUFFER_BIT
Accumulation buffer clear value

GL_COLOR_BUFFER_BIT
GL_ALPHA_TEST enable bit
Alpha test function and reference value
GL_BLEND enable bit
Blending source and destination functions
GL_DITHER enable bit
GL_DRAW_BUFFER setting
GL_LOGIC_OP enable bit
Logic op function
Color mode and index mode clear values
Color mode and index mode writemasks

GL_CURRENT_BIT
Current RGBA color
Current color index
Current normal vector
Current texture coordinates
Current raster position
GL_CURRENT_RASTER_POSITION_VALID flag
RGBA color associated with current raster position
Color index associated with current raster position

Texture coordinates associated with current raster position
GL_EDGE_FLAG flag

GL_DEPTH_BUFFER_BIT

GL_DEPTH_TEST enable bit
Depth buffer test function
Depth buffer clear value
GL_DEPTH_WRITEMASK enable bit

GL_ENABLE_BIT

GL_ALPHA_TEST flag
GL_AUTO_NORMAL flag
GL_BLEND flag
Enable bits for the user-definable clipping planes
GL_COLOR_MATERIAL
GL_CULL_FACE flag
GL_DEPTH_TEST flag
GL_DITHER flag
GL_FOG flag
GL_LIGHT*i* where 0 <= *i* < **GL_MAX_LIGHTS**
GL_LIGHTING flag
GL_LINE_SMOOTH flag
GL_LINE_STIPPLE flag
GL_LOGIC_OP flag
GL_MAP1_*x* where *x* is a map type
GL_MAP2_*x* where *x* is a map type
GL_NORMALIZE flag
GL_POINT_SMOOTH flag
GL_POLYGON_SMOOTH flag
GL_POLYGON_STIPPLE flag
GL_SCISSOR_TEST flag
GL_STENCIL_TEST flag
GL_TEXTURE_1D flag
GL_TEXTURE_2D flag
Flags **GL_TEXTURE_GEN_***x* where *x* is **S**, **T**, **R**, or **Q**

GL_EVAL_BIT

GL_MAP1_*x* enable bits, where *x* is a map type
GL_MAP2_*x* enable bits, where *x* is a map type
1-D grid endpoints and divisions
2-D grid endpoints and divisions
GL_AUTO_NORMAL enable bit

GL_FOG_BIT

GL_FOG enable flag
Fog color
Fog density
Linear fog start
Linear fog end
Fog index
GL_FOG_MODE value

GL_HINT_BIT

GL_PERSPECTIVE_CORRECTION_HINT setting

GL_POINT_SMOOTH_HINT setting
GL_LINE_SMOOTH_HINT setting
GL_POLYGON_SMOOTH_HINT setting
GL_FOG_HINT setting

GL_LIGHTING_BIT
GL_COLOR_MATERIAL enable bit
GL_COLOR_MATERIAL_FACE value
Color material parameters that are tracking the current color
Ambient scene color
GL_LIGHT_MODEL_LOCAL_VIEWER value
GL_LIGHT_MODEL_TWO_SIDE setting
GL_LIGHTING enable bit
Enable bit for each light
Ambient, diffuse, and specular intensity for each light
Direction, position, exponent, and cutoff angle for each light
Constant, linear, and quadratic attenuation factors for each light
Ambient, diffuse, specular, and emissive color for each material
Ambient, diffuse, and specular color indices for each material
Specular exponent for each material
GL_SHADE_MODEL setting

GL_LINE_BIT
GL_LINE_SMOOTH flag
GL_LINE_STIPPLE enable bit
Line stipple pattern and repeat counter
Line width

GL_LIST_BIT
GL_LIST_BASE setting

GL_PIXEL_MODE_BIT
GL_RED_BIAS and **GL_RED_SCALE** settings
GL_GREEN_BIAS and **GL_GREEN_SCALE** values
GL_BLUE_BIAS and **GL_BLUE_SCALE**
GL_ALPHA_BIAS and **GL_ALPHA_SCALE**
GL_DEPTH_BIAS and **GL_DEPTH_SCALE**
GL_INDEX_OFFSET and **GL_INDEX_SHIFT** values
GL_MAP_COLOR and **GL_MAP_STENCIL** flags
GL_ZOOM_X and **GL_ZOOM_Y** factors
GL_READ_BUFFER setting
GL_*x* where *x* is a pixel map table name
GL_*x***_SIZE** where *x* is a pixel map table name

GL_POINT_BIT
GL_POINT_SMOOTH flag
Point size

GL_POLYGON_BIT
GL_CULL_FACE enable bit
GL_CULL_FACE_MODE value
GL_FRONT_FACE indicator
GL_POLYGON_MODE setting
GL_POLYGON_SMOOTH flag

GL_POLYGON_STIPPLE enable bit

GL_POLYGON_STIPPLE_BIT
Polygon stipple image

GL_SCISSOR_BIT
GL_SCISSOR_TEST flag
Scissor box

GL_STENCIL_BUFFER_BIT
GL_STENCIL_TEST enable bit
Stencil function and reference value
Stencil value mask
Stencil fail, pass, and depth buffer pass actions
Stencil buffer clear value
Stencil buffer writemask

GL_TEXTURE_BIT
Enable bits for the four texture coordinates
Border color for each texture image
Minification function for each texture image
Magnification function for each texture image
Texture coordinates and wrap mode for each texture image
Color and mode for each texture environment
Enable bits **GL_TEXTURE_GEN_***x*, *x* is **S**, **T**, **R**, and **Q**
GL_TEXTURE_GEN_MODE setting for **S**, **T**, **R**, and **Q**
glTexGen plane equations for **S**, **T**, **R**, and **Q**

GL_TRANSFORM_BIT
Coefficients of the six clipping planes
Enable bits for the user-definable clipping planes
GL_MATRIX_MODE value
GL_NORMALIZE flag

GL_VIEWPORT_BIT
Depth range (near and far)
Viewport origin and extent

glPopAttrib restores the values of the state variables saved with the last **glPushAttrib** command. Those not saved are left unchanged.

It is an error to push attributes onto a full stack, or to pop attributes off an empty stack. In either case, the error flag is set and no other change is made to GL state.

Initially, the attribute stack is empty.

NOTES

Not all values for GL state can be saved on the attribute stack. For example, pixel pack and unpack state, render mode state, and select and feedback state cannot be saved.

The depth of the attribute stack depends on the implementation, but it must be at least 16.

ERRORS

GL_STACK_OVERFLOW is generated if **glPushAttrib** is called while the attribute stack is full.

GL_STACK_UNDERFLOW is generated if **glPopAttrib** is called while the attribute stack is empty.

GL_INVALID_OPERATION is generated if **glPushAttrib** is called between a call to **glBegin** and the corresponding call to **glEnd**.

glPushName, glPopName

NAME

glPushName, glPopName -- push and pop the name stack

C SPECIFICATION

```
void glPushName(GLuint name)
```

PARAMETERS

name
Specifies a name that will be pushed onto the name stack.

C SPECIFICATION

```
void glPopName(void void)
```

DESCRIPTION

The name stack is used during selection mode to allow sets of rendering commands to be uniquely identified. It consists of an ordered set of unsigned integers. **glPushName** causes *name* to be pushed onto the name stack, which is initially empty. **glPopName** pops one name off the top of the stack.

It is an error to push a name onto a full stack, or to pop a name off an empty stack. It is also an error to manipulate the name stack between a call to **glBegin** and the corresponding call to **glEnd**. In any of these cases, the error flag is set and no other change is made to GL state.

The name stack is always empty while the render mode is not **GL_SELECT**. Calls to **glPushName** or **glPopName** while the render mode is not **GL_SELECT**are ignored.

ERRORS

GL_STACK_OVERFLOW is generated if **glPushName** is called while the name stack is full.

GL_STACK_UNDERFLOW is generated if **glPopName** is called while the name stack is empty.

GL_INVALID_OPERATION is generated if **glPushName** or **glPopName** is called between a call to **glBegin** and the corresponding call to **glEnd**.

```

DESCRIPTION

There is a stack of matrices for each of the matrix modes. In **GL_MODELVIEW** mode, the stack depth is at least 32. In the other two modes, **GL_PROJECTION** and **GL_TEXTURE**, the depth is at least 2. The current matrix in any mode is the matrix on the top of the stack for that mode.

glPushMatrix pushes the current matrix stack down by one, duplicating the current matrix. That is, after a **glPushMatrix** call, the matrix on the top of the stack is identical to the one below it.

glPopMatrix pops the current matrix stack, replacing the current matrix with the one below it on the stack.

Initially, each of the stacks contains one matrix, an identity matrix.

It is an error to push a full matrix stack, or to pop a matrix stack that contains only a single matrix. In either case, the error flag is set and no other change is made to GL state.

ERRORS

GL_STACK_OVERFLOW is generated if **glPushMatrix** is called while the current matrix stack is full.

GL_STACK_UNDERFLOW is generated if **glPopAttrib** is called while the current matrix stack contains only a single matrix.

GL_INVALID_OPERATION is generated if **glPushMatrix** is called between a call to **glBegin** and the corresponding call to **glEnd**.

glReadBuffer

NAME

glReadBuffer -- select a color buffer source for pixels

C SPECIFICATION

```
void glReadBuffer(GLenum mode)
```

PARAMETERS

mode
: Specifies a color buffer. Accepted values are **GL_FRONT_LEFT**, **GL_FRONT_RIGHT**, **GL_BACK_LEFT**, **GL_BACK_RIGHT**, **GL_FRONT**, **GL_BACK**, **GL_LEFT**, **GL_RIGHT**, and **GL_AUX***i*, where *i* is between 0 and **GL_AUX_BUFFERS** - 1.

DESCRIPTION

glReadBuffer specifies a color buffer as the source for subsequent glReadPixels and glCopyPixels commands. *mode* accepts one of twelve or more predefined values. (**GL_AUX0** through **GL_AUX3** are always defined.) In a fully configured system, **GL_FRONT**, **GL_LEFT**, and **GL_FRONT_LEFT** all name the front left buffer, **GL_FRONT_RIGHT** and **GL_RIGHT** name the front right buffer, and **GL_BACK_LEFT** and **GL_BACK** name the back left buffer.

Nonstereo double-buffered configurations have only a front left and a back left buffer. Single-buffered configurations have a front left and a front right buffer if stereo, and only a front left buffer if nonstereo. It is an error to specify a nonexistent buffer to **glReadBuffer**.

By default, *mode* is **GL_FRONT** in single-buffered configurations, and **GL_BACK** in double-buffered configurations.

ERRORS

GL_INVALID_ENUM is generated if *mode* is none of the twelve (or more) accepted values.

GL_INVALID_OPERATION is generated if *mode* specifies a buffer that does not exist.

GL_INVALID_OPERATION is generated if **glReadBuffer** is called between a call to **glBegin** and the corresponding call to **glEnd**.

                   GLshort y,
                   GLshort z,
                   GLshort w)
```

PARAMETERS

x, *y*, *z*, *w*

Specify the *x*, *y*, *z*, and *w* object coordinates (if present) for the raster position.

C SPECIFICATION

```
void glRasterPos2dv(const GLdouble *v)
void glRasterPos2fv(const GLfloat *v)
void glRasterPos2iv(const GLint *v)
void glRasterPos2sv(const GLshort *v)
void glRasterPos3dv(const GLdouble *v)
void glRasterPos3fv(const GLfloat *v)
void glRasterPos3iv(const GLint *v)
void glRasterPos3sv(const GLshort *v)
void glRasterPos4dv(const GLdouble *v)
void glRasterPos4fv(const GLfloat *v)
```

```
void glRasterPos4iv(const GLint *v)
void glRasterPos4sv(const GLshort *v)
```

PARAMETERS

v

Specifies a pointer to an array of two, three, or four elements, specifying *x*, *y*, *z*, and *w* coordinates, respectively.

DESCRIPTION

The GL maintains a 3-D position in window coordinates. This position, called the raster position, is maintained with subpixel accuracy. It is used to position pixel and bitmap write operations. See **glBitmap**, **glDrawPixels**, and **glCopyPixels**.

The current raster position consists of three window coordinates (*x*, *y*, *z*), a clip coordinate *w* value, an eye coordinate distance, a valid bit, and associated color data and texture coordinates. The *w* coordinate is a clip coordinate, because *w* is not projected to window coordinates. **glRasterPos4** specifies object coordinates *x*, *y*, *z*, and *w* explicitly. **glRasterPos3** specifies object coordinate *x*, *y*, and *z* explicitly, while *w* is implicitly set to one. **glRasterPos2** uses the argument values for *x* and *y* while implicitly setting *z* and *w* to zero and one.

The object coordinates presented by **glRasterPos** are treated just like those of a **glVertex** command: They are transformed by the current modelview and projection matrices and passed to the clipping stage. If the vertex is not culled, then it is projected and scaled to window coordinates, which become the new current raster position, and the **GL_CURRENT_RASTER_POSITION_VALID** flag is set. If the vertex is culled, then the valid bit is cleared and the current raster position and associated color and texture coordinates are undefined.

The current raster position also includes some associated color data and texture coordinates. If lighting is enabled, then **GL_CURRENT_RASTER_COLOR**, in RGBA mode, or the **GL_CURRENT_RASTER_INDEX**, in color index mode, is set to the color produced by the lighting calculation (see **glLight**, **glLightModel**, and **glShadeModel**). If lighting is disabled, current color (in RGBA mode, state variable **GL_CURRENT_COLOR**) or color index (in color index mode, state variable **GL_CURRENT_INDEX**) is used to update the current raster color.

Likewise, **GL_CURRENT_RASTER_TEXTURE_COORDS** is updated as a function of **GL_CURRENT_TEXTURE_COORDS**, based on the texture matrix and the texture generation functions (see **glTexGen**). Finally, the distance from the origin of the eye coordinate system to the vertex as transformed by only the modelview matrix replaces **GL_CURRENT_RASTER_DISTANCE**.

Initially, the current raster position is (0, 0, 0, 1), the current raster distance is 0, the valid bit is set, the associated RGBA color is (1, 1, 1, 1), the associated color index is 1, and the associated texture coordinates are (0, 0, 0, 1). In RGBA mode, **GL_CURRENT_RASTER_INDEX** is always 1; in color index mode, the current raster RGBA color always maintains its initial value.

NOTES

The raster position is modified both by **glRasterPos** and by **glBitmap**.

When the raster position coordinates are invalid, drawing commands that are based on the raster position are ignored (that is, they do not result in changes to GL state).

ERRORS

GL_INVALID_OPERATION is generated if **glRasterPos** is called between a call to **glBegin** and the corresponding call to **glEnd**.

glRect

NAME

glRectd, **glRectf**, **glRecti**, **glRects**, **glRectdv**, **glRectfv**, **glRectiv**, **glRectsv** -- draw a rectangle

C SPECIFICATION

```
void glRectd(GLdouble x1,
             GLdouble y1,
             GLdouble x2,
             GLdouble y2)
void glRectf(GLfloat x1,
             GLfloat y1,
             GLfloat x2,
             GLfloat y2)
void glRecti(GLint x1,
             GLint y1,
             GLint x2,
             GLint y2)
void glRects(GLshort x1,
             GLshort y1,
             GLshort x2,
             GLshort y2)
```

PARAMETERS

x1, *y1*
: Specify one vertex of a rectangle.

x2, *y2*
: Specify the opposite vertex of the rectangle.

C SPECIFICATION

```
void glRectdv(const GLdouble *v1,
              const GLdouble *v2)
void glRectfv(const GLfloat *v1,
              const GLfloat *v2)
void glRectiv(const GLint *v1,
              const GLint *v2)
void glRectsv(const GLshort *v1,
              const GLshort *v2)
```

PARAMETERS

v1
: Specifies a pointer to one vertex of a rectangle.

v2
: Specifies a pointer to the opposite vertex of the rectangle.

DESCRIPTION

glRect supports efficient specification of rectangles as two corner points. Each rectangle command takes four arguments, organized either as two consecutive pairs of (x,y) coordinates, or as two pointers to arrays, each containing an (x,y) pair. The resulting rectangle is defined in the $z = 0$ plane.

glRect(*x1*, *y1*, *x2*, *y2*) is exactly equivalent to the following sequence:

```
glBegin(GL_POLYGON);
glVertex2(x1, y1);
glVertex2(x2, y1);
glVertex2(x2, y2);
glVertex2(x1, y2);
glEnd();
```

Note that if the second vertex is above and to the right of the first vertex, the rectangle is constructed with a counterclockwise winding.

ERRORS

GL_INVALID_OPERATION is generated if **glRect** is called between a call to **glBegin** and the corresponding call to **glEnd**.

SEE ALSO

glBegin, **glVertex**

---

glReadPixels

NAME

glReadPixels -- read a block of pixels from the frame buffer

C SPECIFICATION

```
void glReadPixels(GLint x,
                  GLint y,
                  GLsizei width,
                  GLsizei height,
                  GLenum format,
                  GLenum type,
                  GLvoid *pixels)
```

PARAMETERS

x, *y*
: Specify the window coordinates of the first pixel that is read from the frame buffer. This location is the lower left corner of a rectangular block of pixels.

width, *height*
: Specify the dimensions of the pixel rectangle. *width* and *height* of one correspond to a single pixel.

format
: Specifies the format of the pixel data. The following symbolic values are accepted: **GL_COLOR_INDEX**, **GL_STENCIL_INDEX**, **GL_DEPTH_COMPONENT**, **GL_RED**, **GL_GREEN**, **GL_BLUE**, **GL_ALPHA**, **GL_RGB**, **GL_RGBA**, **GL_LUMINANCE**, and **GL_LUMINANCE_ALPHA**.

type
: Specifies the data type of the pixel data. Must be one of **GL_UNSIGNED_BYTE**, **GL_BYTE**, **GL_BITMAP**, **GL_UNSIGNED_SHORT**, **GL_SHORT**, **GL_UNSIGNED_INT**, **GL_INT**, or **GL_FLOAT**.

pixels
: Returns the pixel data.

DESCRIPTION

glReadPixels returns pixel data from the frame buffer, starting with the pixel whose lower left corner is at location (*x*, *y*), into client memory starting at location *pixels*. Several parameters control the processing of the pixel data before it is placed into client memory. These parameters are set with three commands: **glPixelStore**, **glPixelTransfer**, and **glPixelMap**. This reference page describes the effects on **glReadPixels** of most, but not all of the parameters specified by these three commands.

glReadPixels returns values from each pixel with lower left-hand corner at ($x + i$, $y + j$) for $0 <= i < width$ and $0 <= j < height$. This pixel is said to be the *i*th pixel in the *j*th row. Pixels are returned in row order from the lowest to the highest row, left to right in each row.

format specifies the format for the returned pixel values. Accepted values for format are as follows:

GL_COLOR_INDEX
: Color indices are read from the color buffer selected by **glReadBuffer**. Each index is converted to fixed point, shifted left or right depending on the value and sign of **GL_INDEX_SHIFT**, and added to

GL_INDEX_OFFSET. If **GL_MAP_COLOR** is **GL_TRUE**, indices are replaced by their mappings in the table **GL_PIXEL_MAP_I_TO_I**.

GL_STENCIL_INDEX
Stencil values are read from the stencil buffer. Each index is converted to fixed point, shifted left or right depending on the value and sign of **GL_INDEX_SHIFT**, and added to **GL_INDEX_OFFSET**. If **GL_MAP_STENCIL** is **GL_TRUE**, indices are replaced by their mappings in the table **GL_PIXEL_MAP_S_TO_S**.

GL_DEPTH_COMPONENT
Depth values are read from the depth buffer. Each component is converted to floating point such that the minimum depth value maps to 0.0 and the maximum value maps to 1.0. Each component is then multiplied by **GL_DEPTH_SCALE**, added to **GL_DEPTH_BIAS**, and finally clamped to the range [0, 1].

GL_RED

GL_GREEN

GL_BLUE

GL_ALPHA

GL_RGB

GL_RGBA

GL_LUMINANCE

GL_LUMINANCE_ALPHA
Processing differs depending on whether color buffers store color indices or RGBA color components. If color indices are stored, they are read from the color buffer selected by **glReadBuffer**. Each index is converted to fixed point, shifted left or right depending on the value and sign of **GL_INDEX_SHIFT**, and added to **GL_INDEX_OFFSET**. Indices are then replaced by the red, green, blue, and alpha values obtained by indexing the **GL_PIXEL_MAP_I_TO_R**, **GL_PIXEL_MAP_I_TO_G**, **GL_PIXEL_MAP_I_TO_B**, and **GL_PIXEL_MAP_I_TO_A** tables. Each of these tables must be of size 2^*n*, but *n* may be different for different tables. Before an index is used to look up a value in a table of size 2^*n* it must be masked against 2^*n* - 1.

If RGBA color components are stored in the color buffers, they are read from the color buffer selected by glReadBuffer. Each color component is converted to floating point such that zero intensity maps to 0.0 and full intensity maps to 1.0. Each component is then multiplied by **GL_*c*_SCALE** and added to **GL_*c*_BIAS**, where *c* is **RED**, **GREEN**, **BLUE**, or **ALPHA**. Finally, if **GL_MAP_COLOR** is **GL_TRUE**, each component is clamped to the range [0, 1], scaled to the size of its corresponding table, and is then replaced by its mapping in the table **GL_PIXEL_MAP_*c*_TO_*c***, where *c* is **R**, **G**, **B**, or **A**.

Unneeded data is then discarded. For example, **GL_RED** discards the green, blue, and alpha components, while **GL_RGB** discards only the alpha component. **GL_LUMINANCE** computes a single component value as the sum of the red, green, and blue components, and **GL_LUMINANCE_ALPHA** does the same, while keeping alpha as a second value. The final values are clamped to the range [0, 1].

The shift, scale, bias, and lookup factors described above are all specified by **glPixelTransfer**. The lookup table contents themselves are specified by **glPixelMap**.

The final step involves converting the indices or components to the proper format, as specified by *type*. If *format* is **GL_COLOR_INDEX** or **GL_STENCIL_INDEX** and type is not **GL_FLOAT**, each index is masked with the mask value given in the following table. If type is **GL_FLOAT**, then each integer index is converted to single-precision floating-point format.

If *format* is **GL_RED**, **GL_GREEN**, **GL_BLUE**, **GL_ALPHA**, **GL_RGB**, **GL_RGBA**, **GL_LUMINANCE**, or **GL_LUMINANCE_ALPHA** and type is not **GL_FLOAT**, each component is multiplied by the multiplier shown in the following table. If type is **GL_FLOAT**, then each component is passed as is (or converted to the client's single-precision floating-point format if it is different from the one used by the GL).

type	*index mask*	*component conversion*
GL_UNSIGNED_BYTE	2^8-1	$(2^8-1)c$
GL_BYTE	2^7-1	$[(2^7-1)c-1]/2$
GL_BITMAP	1	1
GL_UNSIGNED_SHORT	$2^{16}-1$	$(2^{16}-1)c$
GL_SHORT	$2^{15}-1$	$[(2^{15}-1)c-1]/2$
GL_UNSIGNED_INT	$2^{32}-1$	$(2^{32}-1)c$
GL_INT	$2^{31}-1$	$[(2^{31}-1)c-1]/2$
GL_FLOAT	none	c

Return values are placed in memory as follows. If *format* is **GL_COLOR_INDEX**, **GL_STENCIL_INDEX**, **GL_DEPTH_COMPONENT**, **GL_RED**, **GL_GREEN**, **GL_BLUE**, **GL_ALPHA**, or **GL_LUMINANCE**, a single value is returned and the data for the *i*th pixel in the *j*th row is placed in location *j* * *width* + *i*. **GL_RGB** returns three values, **GL_RGBA** returns four values, and **GL_LUMINANCE_ALPHA** returns two values for each pixel, with all values corresponding to a single pixel occupying contiguous space in *pixels*. Storage parameters set by **glPixelStore**, such as **GL_PACK_SWAP_BYTES** and **GL_PACK_LSB_FIRST**, affect the way that data is written into memory. See **glPixelStore** for a description.

NOTES

Values for pixels that lie outside the window connected to the current GL context are undefined.

If an error is generated, no change is made to the contents of *pixels*.

ERRORS

GL_INVALID_ENUM is generated if *format* or *type* is not an accepted value.

GL_INVALID_VALUE is generated if either *width* or *height* is not negative.

GL_INVALID_OPERATION is generated if *format* is **GL_COLOR_INDEX** and the color buffers store RGBA color components.

GL_INVALID_OPERATION is generated if *format* is **GL_STENCIL_INDEX** and there is no stencil buffer.

GL_INVALID_OPERATION is generated if *format* is **GL_DEPTH_COMPONENT** and there is no depth buffer.

GL_INVALID_OPERATION is generated if **glReadPixels** is called between a call to **glBegin** and the corresponding call to **glEnd**.

glRotate

NAME

glRotated, **glRotatef** -- multiply the current matrix by a rotation matrix

C SPECIFICATION

```
void glRotated(GLdouble angle,
               GLdouble x,
               GLdouble y,
               GLdouble z)
void glRotatef(GLfloat angle,
               GLfloat x,
               GLfloat y,
               GLfloat z)
```

PARAMETERS

angle
: Specifies the angle of rotation, in degrees.

x, *y*, *z*
: Specify the *x*, *y*, and *z* coordinates of a vector, respectively.

DESCRIPTION

glRotate computes a matrix that performs a counterclockwise rotation of *angle* degrees about the vector from the origin through the point (*x*, *y*, *z*).

The current matrix (see **glMatrixMode**) is multiplied by this rotation matrix, with the product replacing the current matrix. That is, if M is the current matrix and R is the rotation matrix, then M is replaced with M * R.

If the matrix mode is either **GL_MODELVIEW** or **GL_PROJECTION**, all objects drawn after **glRotate** is called are rotated. Use **glPushMatrix** and **glPopMatrix** to save and restore the unrotated coordinate system.

ERRORS

GL_INVALID_OPERATION is generated if **glRotate** is called between a call to **glBegin** and the corresponding call to **glEnd**.

glRenderMode

NAME

glRenderMode -- set rasterization mode

C SPECIFICATION

```
GLint glRenderMode(GLenum mode)
```

PARAMETERS

mode
: Specifies the rasterization mode. Three values are accepted: **GL_RENDER**, **GL_SELECT**, and **GL_FEEDBACK**. The default value is **GL_RENDER**.

DESCRIPTION

glRenderMode sets the rasterization mode. It takes one argument, *mode*, which can assume one of three predefined values:

GL_RENDER
: Render mode. Primitives are rasterized, producing pixel fragments, which are written into the frame buffer. This is the normal mode and also the default mode.

GL_SELECT
: Selection mode. No pixel fragments are produced, and no change to the frame buffer contents is made. Instead, a record of the names of primitives that would have been drawn if the render mode was **GL_RENDER** is returned in a select buffer, which must be created (see **glSelectBuffer**) before selection mode is entered.

GL_FEEDBACK
: Feedback mode. No pixel fragments are produced, and no change to the frame buffer contents is made. Instead, the coordinates and attributes of vertices that would have been drawn had the render mode been **GL_RENDER** is returned in a feedback buffer, which must be created (see **glFeedbackBuffer**) before feedback mode is entered.

The return value of **glRenderMode** is determined by the render mode at the time **glRenderMode** is called, rather than by *mode*. The values returned for the three render modes are as follows:

GL_RENDER
: Zero.

GL_SELECT
: The number of hit records transferred to the select buffer.

GL_FEEDBACK
: The number of values (not vertices) transferred to the feedback buffer.

Refer to the **glSelectBuffer** and **glFeedbackBuffer** reference pages for more details concerning selection and feedback operation.

NOTES

If an error is generated, **glRenderMode** returns zero regardless of the current render mode.

ERRORS

GL_INVALID_ENUM is generated if *mode* is not one of the three accepted values.

GL_INVALID_OPERATION is generated if **glSelectBuffer** is called while the render mode is **GL_SELECT**, or if **glRenderMode** is called with argument **GL_SELECT** before **glSelectBuffer** is called at least once.

GL_INVALID_OPERATION is generated if **glFeedbackBuffer** is called while the render mode is **GL_FEEDBACK**, or if **glRenderMode** is called with argument **GL_FEEDBACK** before **glFeedbackBuffer** is called at least once..

GL_INVALID_OPERATION is generated if **glRenderMode** is called between a call to **glBegin** and the corresponding call to **glEnd**.

glScissor

NAME

glScissor -- define the scissor box

C SPECIFICATION

```
void glScissor(GLint x,
               GLint y,
               GLsizei width,
               GLsizei height)
```

PARAMETERS

x, *y*
: Specify the lower left corner of the scissor box. Initially (0, 0).

width, *height*
: Specify the width and height of the scissor box. When a GL context is *first* attached to a window, *width* and *height* are set to the dimensions of that window.

DESCRIPTION

The **glScissor** routine defines a rectangle, called the scissor box, in window coordinates. The first two arguments, *x* and *y*, specify the lower left corner of the box. *width* and *height* specify the width and height of the box.

The scissor test is enabled and disabled using **glEnable** and **glDisable** with argument **GL_SCISSOR_TEST**. While the scissor test is enabled, only pixels that lie within the scissor box can be modified by drawing commands. Window coordinates have integer values at the shared corners of frame buffer pixels, so **glScissor**(0, 0, 1, 1) allows only the lower left pixel in the window to be modified, and **glScissor**(0, 0, 0, 0) disallows modification to all pixels in the window.

When the scissor test is disabled, it is as though the scissor box includes the entire window.

ERRORS

GL_INVALID_VALUE is generated if either *width* or *height* is negative.

GL_INVALID_OPERATION is generated if **glScissor** is called between a call to **glBegin** and the corresponding call to **glEnd**.

ASSOCIATED GETS

glScale

NAME

glScaled, **glScalef** -- multiply the current matrix by a general scaling matrix

C SPECIFICATION

```
void glScaled(GLdouble x,
              GLdouble y,
              GLdouble z)
void glScalef(GLfloat x,
              GLfloat y,
              GLfloat z)
```

PARAMETERS

x, *y*, *z*
: Specify scale factors along the *x*, *y*, and *z* axes, respectively.

DESCRIPTION

glScale produces a general scaling along the *x*, *y*, and *z* axes. The three arguments indicate the desired scale factors along each of the three axes. The resulting matrix is

$$\begin{pmatrix} x & 0 & 0 & 0 \\ 0 & y & 0 & 0 \\ 0 & 0 & z & 0 \\ 0 & 0 & 0 & 1 \end{pmatrix}$$

The current matrix (see **glMatrixMode**) is multiplied by this scale matrix, with the product replacing the current matrix. That is, if M is the current matrix and S is the scale matrix, then M is replaced with M * S.

If the matrix mode is either **GL_MODELVIEW** or **GL_PROJECTION**, all objects drawn after **glScale** is called are scaled. Use **glPushMatrix** and **glPopMatrix** to save and restore the unscaled coordinate system.

NOTES

If scale factors other than 1.0 are applied to the modelview matrix and lighting is enabled, automatic normalization of normals should probably also be enabled (**glEnable** and **glDisable** with argument **GL_NORMALIZE**).

ERRORS

GL_INVALID_OPERATION is generated if **glScale** is called between a call to **glBegin** and the corresponding call to **glEnd**.

glShadeModel

NAME

glShadeModel -- select flat or smooth shading

C SPECIFICATION

```
void glShadeModel(GLenum mode)
```

PARAMETERS

mode
: Specifies a symbolic value representing a shading technique. Accepted values are **GL_FLAT** and **GL_SMOOTH**. The default is **GL_SMOOTH**.

DESCRIPTION

GL primitives can have either flat or smooth shading. Smooth shading, the default, causes the computed colors of vertices to be interpolated as the primitive is rasterized, typically assigning different colors to each resulting pixel fragment. Flat shading selects the computed color of just one vertex and assigns it to all the pixel fragments generated by rasterizing a single primitive. In either case, the computed color of a vertex is the result of lighting, if lighting is enabled, or it is the current color at the time the vertex was specified, if lighting is disabled.

Flat and smooth shading are indistinguishable for points. Counting vertices and primitives from one starting when **glBegin** is issued, each flat-shaded line segment i is given the computed color of vertex $i + 1$, its second vertex. Counting similarly from one, each flat-shaded polygon is given the computed color of the vertex listed in the following table. This is the last vertex to specify the polygon in all cases except single polygons, where the first vertex specifies the flat-shaded color.

primitive type of polygon i	*vertex*
Single Polygon ($i \equiv 1$)	1
Triangle strip	$i+2$
Triangle fan	$i+2$
Independent triangle	$3i$
Quad strip	$2i+2$
Independent quad	$4i$

Flat and smooth shading are specified by **glShadeModel** with *mode* set to **GL_FLAT** and **GL_SMOOTH**, respectively.

ERRORS

GL_INVALID_ENUM is generated if *mode* is any value other than **GL_FLAT** or **GL_SMOOTH**.

GL_INVALID_OPERATION is generated if **glShadeModel** is called between a call to **glBegin** and the corresponding call to **glEnd**.

glSelectBuffer

NAME

glSelectBuffer -- establish a buffer for selection mode values

C SPECIFICATION

```
void glSelectBuffer(GLsizei size,
                    GLuint *buffer)
```

PARAMETERS

size
: Specifies the size of buffer.

buffer
: Returns the selection data.

DESCRIPTION

glSelectBuffer has two arguments: *buffer* is a pointer to an array of unsigned integers, and *size* indicates the size of the array. *buffer* returns values from the name stack (see **glInitNames**, **glLoadName**, **glPushName**) when the rendering mode is **GL_SELECT** (see **glRenderMode**). **glSelectBuffer** must be issued before selection mode is enabled, and it must not be issued while the rendering mode is **GL_SELECT**.

Selection is used by a programmer to determine which primitives are drawn into some region of a window. The region is defined by the current modelview and perspective matrices.

In selection mode, no pixel fragments are produced from rasterization. Instead, if a primitive intersects the clipping volume defined by the viewing frustum and the user-defined clipping planes, this primitive causes a selection hit. (With polygons, no hit occurs if the polygon is culled.) When a change is made to the name stack, or when glRenderMode is called, a hit record is copied to *buffer* if any hits have occurred since the last such event (name stack change or glRenderMode call). The hit record consists of the number of names in the name stack at the time of the event, followed by the minimum and maximum depth values of all vertices that hit since the previous event, followed by the name stack contents, bottom name first.

Returned depth values are mapped such that the largest unsigned integer value corresponds to window coordinate depth 1.0, and zero corresponds to window coordinate depth 0.0.

An internal index into *buffer* is reset to zero whenever selection mode is entered. Each time a hit record is copied into *buffer*, the index is incremented to point to the cell just past the end of the block of names - that is, to the next available cell. If the hit record is larger than the number of remaining locations in buffer, as much data as can fit is copied, and the overflow flag is set. If the name stack is empty when a hit record is copied, that record consists of zero followed by the minimum and maximum depth values.

Selection mode is exited by calling **glRenderMode** with an argument other than **GL_SELECT**. Whenever **glRenderMode** is called while the render mode is **GL_SELECT**, it returns the number of hit records copied to *buffer*, resets the overflow flag and the selection buffer pointer, and initializes the name stack to be empty. If the overflow bit was set when **glRenderMode** was called, a negative hit record count is returned.

NOTES

The contents of *buffer* are undefined until **glRenderMode** is called with an argument other than **GL_SELECT**.

glBegin / **glEnd** primitives and calls to **glRasterPos** can result in hits.

ERRORS

GL_INVALID_VALUE is generated if *size* is negative.

GL_INVALID_OPERATION is generated if **glSelectBuffer** is called while the render mode is **GL_SELECT**, or if **glRenderMode** is called with argument **GL_SELECT** before **glSelectBuffer** is called at least once.

GL_INVALID_OPERATION is generated if **glSelectBuffer** is called between a call to **glBegin** and the corresponding call to **glEnd**.

glStencilMask

NAME

glStencilMask -- control the writing of individual bits in the stencil planes

C SPECIFICATION

```
void glStencilMask(GLuint mask)
```

PARAMETERS

mask
: Specifies a bit mask to enable and disable writing of individual bits in the stencil planes. Initially, the mask is all ones.

DESCRIPTION

glStencilMask controls the writing of individual bits in the stencil planes. The least significant *n* bits of *mask*, where *n* is the number of bits in the stencil buffer, specify a mask. Wherever a one appears in the mask, the corresponding bit in the stencil buffer is made writable. Where a zero appears, the bit is write-protected. Initially, all bits are enabled for writing.

ERRORS

GL_INVALID_OPERATION is generated if **glStencilMask** is called between a call to **glBegin** and the corresponding call to **glEnd**.

ASSOCIATED GETS

glGet with argument **GL_STENCIL_WRITEMASK**
glGet with argument **GL_STENCIL_BITS**

glStencilFunc

NAME

glStencilFunc -- set function and reference value for stencil testing

C SPECIFICATION

```
void glStencilFunc(GLenum func,
                   GLint ref,
                   GLuint mask)
```

PARAMETERS

func
: Specifies the test function. Eight tokens are valid: **GL_NEVER**, **GL_LESS**, **GL_LEQUAL**, **GL_GREATER**, **GL_GEQUAL**, **GL_EQUAL**, **GL_NOTEQUAL**, and **GL_ALWAYS**.

ref
: Specifies the reference value for the stencil test. *ref* is clamped to the range [0, 2^*n* - 1], where *n* is the number of bitplanes in the stencil buffer.

mask
: Specifies a mask that is ANDed with both the reference value and the stored stencil value when the test is done.

DESCRIPTION

Stenciling, like z-buffering, enables and disables drawing on a per-pixel basis. You draw into the stencil planes using GL drawing primitives, then render geometry and images, using the stencil planes to mask out portions of the screen. Stenciling is typically used in multipass rendering algorithms to achieve special effects, such as decals, outlining, and constructive solid geometry rendering.

The stencil test conditionally eliminates a pixel based on the outcome of a comparison between the reference value and the value in the stencil buffer. The test is enabled by **glEnable** and **glDisable** with argument **GL_STENCIL_TEST**. Actions taken based on the outcome of the stencil test are specified with **glStencilOp**.

func is a symbolic constant that determines the stencil comparison function. It accepts one of eight values, shown below. *ref* is an integer reference value that is used in the stencil comparison. It is clamped to the range [0, 2^*n* - 1], where *n* is the number of bitplanes in the stencil buffer. *mask* is bitwise ANDed with both the reference value and the stored stencil value, with the ANDed values participating in the comparison.

If *stencil* represents the value stored in the corresponding stencil buffer location, the following list shows the effect of each comparison function that can be specified by *func*. Only if the comparison succeeds is the pixel passed through to the next stage in the rasterization process (see **glStencilOp**). All tests treat stencil values as unsigned integers in the range [0, 2^*n* - 1], where *n* is the number of bitplanes in the stencil buffer.

Here are the values accepted by *func*:

GL_NEVER
: Always fails.

GL_LESS
: Passes if (*ref* & *mask*) < (*stencil* & *mask*).

GL_LEQUAL
Passes if (*ref* & *mask*) <= (*stencil* & *mask*).

GL_GREATER
Passes if (*ref* & *mask*) > (*stencil* & *mask*).

GL_GEQUAL
Passes if (*ref* & *mask*) >= (*stencil* & *mask*).

GL_EQUAL
Passes if (*ref* & *mask*) == (*stencil* & *mask*).

GL_NOTEQUAL
Passes if (*ref* & *mask*) != (*stencil* & *mask*).

GL_ALWAYS
Always passes.

NOTES

Initially, the stencil test is disabled. If there is no stencil buffer, no stencil modification can occur and it is as if the stencil test always passes.

ERRORS

GL_INVALID_ENUM is generated if *func* is not one of the eight accepted values.

GL_INVALID_OPERATION is generated if **glStencilFunc** is called between a call to **glBegin** and the corresponding call to **glEnd**.

void glTexCoord3iv(const GLint *v)
void glTexCoord3sv(const GLshort *v)
void glTexCoord4dv(const GLdouble *v)
void glTexCoord4fv(const GLfloat *v)
void glTexCoord4iv(const GLint *v)
void glTexCoord4sv(const GLshort *v)
```

PARAMETERS

v

Specifies a pointer to an array of one, two, three, or four elements, which in turn specify the *s*, *t*, *r*, and *q* texture coordinates.

DESCRIPTION

The current texture coordinates are part of the data that is associated with each vertex and with the current raster position. They are set with **glTexCoord**.

glTexCoord specifies texture coordinates in one, two, three, or four dimensions. **glTexCoord1** sets the current texture coordinates to (*s*, 0, 0, 1); a call to **glTexCoord2** sets them to (*s*, *t*, 0, 1). Similarly, **glTexCoord3** specifies the texture coordinates as (*s*, *t*, *r*, 1), and **glTexCoord4** defines all four components explicitly as (*s*, *t*, *r*, *q*).

NOTES

The current texture coordinates can be updated at any time. In particular, **glTexCoord** can be called between a call to **glBegin** and the corresponding call to **glEnd**.

glStencilOp

NAME

glStencilOp -- set stencil test actions

C SPECIFICATION

```
void glStencilOp(GLenum fail,
                 GLenum zfail,
                 GLenum zpass)
```

PARAMETERS

fail
: Specifies the action to take when the stencil test fails. Six symbolic constants are accepted: **GL_KEEP**, **GL_ZERO**, **GL_REPLACE**, **GL_INCR**, **GL_DECR**, and **GL_INVERT**.

zfail
: Specifies stencil action when the stencil test passes, but the depth test fails. *zfail* accepts the same symbolic constants as *fail*.

zpass
: Specifies stencil action when both the stencil test and the depth test pass, or when the stencil test passes and either there is no depth buffer or depth testing is not enabled. *zpass* accepts the same symbolic constants as *fail*.

DESCRIPTION

Stenciling, like z-buffering, enables and disables drawing on a per-pixel basis. You draw into the stencil planes using GL drawing primitives, then render geometry and images, using the stencil planes to mask out portions of the screen. Stenciling is typically used in multipass rendering algorithms to achieve special effects, such as decals, outlining, and constructive solid geometry rendering.

The stencil test conditionally eliminates a pixel based on the outcome of a comparison between the value in the stencil buffer and a reference value. The test is enabled with **glEnable** and **glDisable** calls with argument **GL_STENCIL_TEST**, and controlled with **glStencilFunc**.

glStencilOp takes three arguments that indicate what happens to the stored stencil value while stenciling is enabled. If the stencil test fails, no change is made to the pixel's color or depth buffers, and *fail* specifies what happens to the stencil buffer contents. The six possible actions are as follows:

GL_KEEP
: Keeps the current value.

GL_ZERO
: Sets the stencil buffer value to zero.

GL_REPLACE
: Sets the stencil buffer value to *ref*, as specified by **glStencilFunc**.

GL_INCR
: Increments the current stencil buffer value. Clamps to the maximum representable unsigned value.

GL_DECR
Decrements the current stencil buffer value. Clamps to zero.

GL_INVERT
Bitwise inverts the current stencil buffer value.

Stencil buffer values are treated as unsigned integers. When incremented and decremented, values are clamped to 0 and $2^n - 1$, where *n* is the value returned by querying **GL_STENCIL_BITS**.

The other two arguments to **glStencilOp** specify stencil buffer actions should subsequent depth buffer tests succeed (*zpass*) or fail (*zfail*). (See **glDepthFunc**.) They are specified using the same six symbolic constants as *fail*. Note that *zfail* is ignored when there is no depth buffer, or when the depth buffer is not enabled. In these cases, *fail* and *zpass* specify stencil action when the stencil test fails and passes, respectively.

NOTES

Initially the stencil test is disabled. If there is no stencil buffer, no stencil modification can occur and it is as if the stencil tests always pass, regardless of any call to **glStencilOp**.

ERRORS

GL_INVALID_ENUM is generated if *fail*, *zfail*, or *zpass* is any value other than the six defined constant values.

GL_INVALID_OPERATION is generated if **glStencilOp** is called between a call to **glBegin** and the corresponding call to **glEnd**.

glTexGen

NAME

glTexGend, **glTexGenf**, **glTexGeni**, **glTexGendv**, **glTexGenfv**, **glTexGeniv** -- control the generation of texture coordinates

C SPECIFICATION

```
void glTexGend(GLenum coord,
               GLenum pname,
               GLdouble param)
void glTexGenf(GLenum coord,
               GLenum pname,
               GLfloat param)
void glTexGeni(GLenum coord,
               GLenum pname,
               GLint param)
```

PARAMETERS

coord
: Specifies a texture coordinate. Must be one of the following: **GL_S**, **GL_T**, **GL_R**, or **GL_Q**.

pname
: Specifies the symbolic name of the texture-coordinate generation function. Must be **GL_TEXTURE_GEN_MODE**.

param
: Specifies a single-valued texture generation parameter, one of **GL_OBJECT_LINEAR**, **GL_EYE_LINEAR**, or **GL_SPHERE_MAP**.

C SPECIFICATION

```
void glTexGendv(GLenum coord,
                GLenum pname,
                const GLdouble *params)
void glTexGenfv(GLenum coord,
                GLenum pname,
                const GLfloat *params)
void glTexGeniv(GLenum coord,
                GLenum pname,
                const GLint *params)
```

PARAMETERS

coord
: Specifies a texture coordinate. Must be one of the following: **GL_S**, **GL_T**, **GL_R**, or **GL_Q**.

pname
: Specifies the symbolic name of the texture-coordinate generation function or function parameters. Must be **GL_TEXTURE_GEN_MODE**, **GL_OBJECT_PLANE**, or **GL_EYE_PLANE**.

params
: Specifies a pointer to an array of texture generation parameters. If *pname* is **GL_TEXTURE_GEN_MODE**, then the array must contain a single symbolic constant, one of **GL_OBJECT_LINEAR**, **GL_EYE_LINEAR**, or **GL_SPHERE_MAP**. Otherwise, *params* holds the coefficients for the texture-coordinate generation function

specified by *pname*.

DESCRIPTION

glTexGen selects a texture-coordinate generation function or supplies coefficients for one of the functions. *coord* names one of the (*s*, *t*, *r*, *q*) texture coordinates, and it must be one of these symbols: **GL_S**, **GL_T**, **GL_R**, or **GL_Q**. *pname* must be one of three symbolic constants: **GL_TEXTURE_GEN_MODE**, **GL_OBJECT_PLANE**, or **GL_EYE_PLANE**. If *pname* is **GL_TEXTURE_GEN_MODE**, then *params* chooses a mode, one of **GL_OBJECT_LINEAR**, **GL_EYE_LINEAR**, or **GL_SPHERE_MAP**. If *pname* is either **GL_OBJECT_PLANE** or **GL_EYE_PLANE**, *params* contains coefficients for the corresponding texture generation function.

If the texture generation function is **GL_OBJECT_LINEAR**, the function

$$g = p1 * xo + p2 * yo + p3 * zo + p4 * wo$$

is used, where *g* is the value computed for the coordinate named in *coord*, *p1*, *p2*, *p3*, and *p4* are the four values supplied in *params*, and *xo*, *yo*, *zo*, and *wo* are the object coordinates of the vertex. This function can be used to texture-map terrain using sea level as a reference plane (defined by *p1*, *p2*, *p3*, and *p4*). The altitude of a terrain vertex is computed by the **GL_OBJECT_LINEAR** coordinate generation function as its distance from sea level; that altitude is used to index the texture image to map white snow onto peaks and green grass onto foothills, for example.

If the texture generation function is **GL_EYE_LINEAR**, the function

$$g = p1' * xe + p2' * ye + p3' * ze + p4' * we$$

is used, where

$$(p1'\ p2'\ p3'\ p4') = (p1\ p2\ p3\ p4) * M\text{^-}1$$

and *xe*, *ye*, *ze*, and *we* are the eye coordinates of the vertex, *p1*, *p2*, *p3*, and *p4* are the values supplied in *params*, and *M* is the modelview matrix when **glTexGen** is invoked. If *M* is poorly conditioned or singular, texture coordinates generated by the resulting function may be inaccurate or undefined.

Note that the values in *params* define a reference plane in eye coordinates. The modelview matrix that is applied to them may not be the same one in effect when the polygon vertices are transformed. This function establishes a field of texture coordinates that can produce dynamic contour lines on moving objects.

If *pname* is **GL_SPHERE_MAP** and *coord* is either **GL_S** or **GL_T**, *s* and *t* texture coordinates are generated as follows. Let **u** be the unit vector pointing from the origin to the polygon vertex (in eye coordinates). Let **n**' be the current normal, after transformation to eye coordinates. Let **f** = (*fx fy fz*)^*T* be the reflection vector such that

$$\mathbf{f} = \mathbf{u} - 2\mathbf{n}'\mathbf{n}'^T\mathbf{u}$$

Finally, let *m* = 2(*fx*^2 + *fy*^2 + (*fz* + 1)^2)^(1/2). Then the values assigned to the *s* and *t* texture coordinates are

$$s = \frac{f_x}{m} + \frac{1}{2}$$

$$t = \frac{f_y}{m} + \frac{1}{2}$$

A texture-coordinate generation function is enabled or disabled using **glEnable** or **glDisable** with one of the symbolic texture-coordinate names (**GL_TEXTURE_GEN_S**, **GL_TEXTURE_GEN_T**, **GL_TEXTURE_GEN_R**, or **GL_TEXTURE_GEN_Q**) as the argument. When enabled, the specified texture coordinate is computed according to the generating function associated with that coordinate. When disabled, subsequent vertices take the specified texture coordinate from the current set of texture coordinates. Initially, all texture generation functions are set to **GL_EYE_LINEAR** and are disabled. Both *s* plane equations are (1, 0, 0, 0), both *t* plane equations are (0, 1, 0, 0), and all *r* and *q* plane equations are (0, 0, 0, 0).

ERRORS

GL_INVALID_ENUM is generated when *coord* or *pname* is not an accepted defined value, or when *pname* is **GL_TEXTURE_GEN_MODE** and *params* is not an accepted defined value.

GL_INVALID_ENUM is generated when *pname* is **GL_TEXTURE_GEN_MODE**, *params* is **GL_SPHERE_MAP**, and *coord* is either **GL_R** or **GL_Q**.

GL_INVALID_OPERATION is generated if **glTexGen** is called between a call to **glBegin** and the corresponding call to **glEnd**.

PARAMETERS

target
: Specifies a texture environment. Must be **GL_TEXTURE_ENV**.

pname
: Specifies the symbolic name of a texture environment parameter. Accepted values are **GL_TEXTURE_ENV_MODE** and **GL_TEXTURE_ENV_COLOR**.

params
: Specifies a pointer to an array of parameters: either a single symbolic constant or an RGBA color.

DESCRIPTION

A texture environment specifies how texture values are interpreted when a fragment is textured. *target* must be **GL_TEXTURE_ENV**. *pname* can be either **GL_TEXTURE_ENV_MODE** or **GL_TEXTURE_ENV_COLOR**.

If *pname* is **GL_TEXTURE_ENV_MODE**, then *params* is (or points to) the symbolic name of a texture function. Three texture functions may be defined: **GL_MODULATE**, **GL_DECAL**, and **GL_BLEND**.

A texture function acts on the fragment to be textured using the texture image value that applies to the fragment (see **glTexParameter**) and produces an RGBA color for that fragment. The following table shows how the RGBA color is produced for each of the three texture functions that can be chosen. *C* is a triple of color values (RGB) and *A* is the associated alpha value. RGBA values extracted from a texture image are in the range [0, 1]. The subscript *f* refers to the incoming fragment, the subscript *t* to the texture image, the subscript *c* to the texture environment color, and subscript *v* indicates a value produced by the texture function.

A texture image can have up to four components per texture element (see **glTexImage1D** and **glTexImage2D**). In a one-component image, *Lt* indicates that single component. A two-component image uses *Lt* and *At*. A three-component image has only a color value, *Ct*. A four-component image has both a color value *Ct* and an alpha value *At*.

number of components	*texture functions* GL_MODULATE	GL_DECAL	GL_BLEND
1	$C_v = L_t C_f$ $A_v = A_f$	undefined	$C_v = (1 - L_t)C_f + L_t C_c$ $A_v = A_f$
2	$C_v = L_t C_f$ $A_v = A_t A_f$	undefined	$C_v = (1 - L_t)C_f + L_t C_c$ $A_v = A_t A_f$
3	$C_v = C_t C_f$ $A_v = A_f$	$C_v = C_t$ $A_v = A_f$	undefined
4	$C_v = C_t C_f$ $A_v = A_t A_f$	$C_v = (1 - A_t)C_f + A_t C_t$ $A_v = A_f$	undefined

If *pname* is **GL_TEXTURE_ENV_COLOR**, *params* is a pointer to an array that holds an RGBA color consisting of four values. Integer color components are interpreted linearly such that the most positive integer maps to 1.0, and the most negative integer maps to -1.0. The values are clamped to the range [0, 1] when they are specified. *Cc* takes these four values.

GL_TEXTURE_ENV_MODE defaults to **GL_MODULATE** and **GL_TEXTURE_ENV_COLOR** defaults to (0, 0, 0, 0).

ERRORS

GL_INVALID_ENUM is generated when *target* or *pname* is not one of the accepted defined values, or when *params* should have a defined constant value (based on the value of *pname*) and does not.

GL_INVALID_OPERATION is generated if **glTexEnv** is called between a call to **glBegin** and the corresponding call to **glEnd**.

glTexImage2D

NAME

glTexImage2D -- specify a two-dimensional texture image

C SPECIFICATION

```
void glTexImage2D(GLenum target,
                  GLint level,
                  GLint components,
                  GLsizei width,
                  GLsizei height,
                  GLint border,
                  GLenum format,
                  GLenum type,
                  const GLvoid *pixels)
```

PARAMETERS

target
: Specifies the target texture. Must be **GL_TEXTURE_2D**.

level
: Specifies the level-of-detail number. Level 0 is the base image level. Level *n* is the *n*th mipmap reduction image.

components
: Specifies the number of color components in the texture. Must be 1, 2, 3, or 4.

width
: Specifies the width of the texture image. Must be 2^*n* + 2 * (*border*) for some integer *n*.

height
: Specifies the height of the texture image. Must be 2^*m* + 2 * (*border*) for some integer *m*.

border
: Specifies the width of the border. Must be either 0 or 1.

format
: Specifies the format of the pixel data. The following symbolic values are accepted: **GL_COLOR_INDEX**, **GL_RED**, **GL_GREEN**, **GL_BLUE**, **GL_ALPHA**, **GL_RGB**, **GL_RGBA**, **GL_LUMINANCE**, and **GL_LUMINANCE_ALPHA**.

type
: Specifies the data type of the pixel data. The following symbolic values are accepted: **GL_UNSIGNED_BYTE**, **GL_BYTE**, **GL_BITMAP**, **GL_UNSIGNED_SHORT**, **GL_SHORT**, **GL_UNSIGNED_INT**, **GL_INT**, and **GL_FLOAT**.

pixels
: Specifies a pointer to the image data in memory.

DESCRIPTION

Texturing maps a portion of a specified *texture image* onto each graphical primitive for which texturing is enabled.

Two-dimensional texturing is enabled and disabled using **glEnable** and **glDisable** with argument **GL_TEXTURE_2D**.

Texture images are defined with **glTexImage2D**. The arguments describe the parameters of the texture image, such as height, width, width of the border, level-of-detail number (see **glTexParameter**), and number of color componenents provided. The last three arguments describe the way the image is represented in memory, and they are identical to the pixel formats used for **glDrawPixels**.

Data is read from *pixels* as a sequence of signed or unsigned bytes, shorts, or longs, or single-precision floating-point values, depending on *type*. These values are grouped into sets of one, two, three, or four values, depending on *format*, to form an element. If *type* is **GL_BITMAP**, the data is considered as a string of unsigned bytes (and *format* must be **GL_COLOR_INDEX**). Each data byte is treated as eight 1-bit elements, with bit ordering determined by **GL_UNPACK_LSB_FIRST** (see **glPixelStore**).

format determines the composition of each element in *pixels* and selects the target frame buffer. It can assume one of nine symbolic values:

GL_COLOR_INDEX
: Each element is a single value, a color index. It is converted to fixed point (with an unspecified number of zero bits to the right of the binary point), shifted left or right depending on the value and sign of **GL_INDEX_SHIFT**, and added to **GL_INDEX_OFFSET** (see **glPixelTransfer**). The resulting index is converted to a set of color components using the **GL_PIXEL_MAP_I_TO_R**, **GL_PIXEL_MAP_I_TO_G**, **GL_PIXEL_MAP_I_TO_B**, and **GL_PIXEL_MAP_I_TO_A** tables, and clamped to the range [0, 1].

GL_RED
: Each element is a single red component. It is converted to floating point and assembled into an RGBA element by attaching 0.0 for green and blue, and 1.0 for alpha. Each component is then multiplied by the signed scale factor **GL_c_SCALE**, added to the signed bias **GL_c_BIAS**, and clamped to the range [0, 1] (see **glPixelTransfer**).

GL_GREEN
: Each element is a single green component. It is converted to floating point and assembled into an RGBA element by attaching 0.0 for red and blue, and 1.0 for alpha. Each component is then multiplied by the signed scale factor **GL_c_SCALE**, added to the signed bias **GL_c_BIAS**, and clamped to the range [0, 1] (see **glPixelTransfer**).

GL_BLUE
: Each element is a single blue component. It is converted to floating point and assembled into an RGBA element by attaching 0.0 for red and green, and 1.0 for alpha. Each component is then multiplied by the signed scale factor **GL_c_SCALE**, added to the signed bias **GL_c_BIAS**, and clamped to the range [0, 1] (see **glPixelTransfer**).

GL_ALPHA
: Each element is a single alpha component. It is converted to floating point and assembled into an RGBA element by attaching 0.0 for red, green and blue. Each component is then multiplied by the signed scale factor **GL_c_SCALE**, added to the signed bias **GL_c_BIAS**, and clamped to the range [0, 1] (see **glPixelTransfer**).

GL_RGB
: Each element is an RGB triple. It is converted to floating point and assembled into an RGBA element by attaching 1.0 for alpha. Each component is then multiplied by the signed scale factor **GL_c_SCALE**, added to the signed bias **GL_c_BIAS**, and clamped to the range [0, 1] (see **glPixelTransfer**).

GL_RGBA,
: Each element contains all four components. Each component is multiplied by the signed scale factor **GL_c_SCALE**, added to the signed bias **GL_c_BIAS**, and clamped to the range [0, 1] (see **glPixelTransfer**).

GL_LUMINANCE

Each element is a single luminance value. It is converted to floating point, then assembled into an RGBA element by replicating the luminance value three times for red, green, and blue and attaching 1.0 for alpha. Each component is then multiplied by the signed scale factor **GL_c_SCALE**, added to the signed bias **GL_c_BIAS**, and clamped to the range [0, 1] (see **glPixelTransfer**).

GL_LUMINANCE_ALPHA

Each element is a luminance/alpha pair. It is converted to floating point, then assembled into an RGBA element by replicating the luminance value three times for red, green, and blue. Each component is then multiplied by the signed scale factor **GL_c_SCALE**, added to the signed bias **GL_c_BIAS**, and clamped to the range [0, 1] (see **glPixelTransfer**).

Please refer to the **glDrawPixels** reference page for a description of the acceptable values for the *type* parameter.

A texture image can have up to four components per texture element, depending on *components*. A one-component texture image uses only the red component of the RGBA color extracted from *pixels*. A two-component image uses the R and A values. A three-component image uses the R, G, and B values. A four-component image uses all of the RGBA components

NOTES

Texturing has no effect in color index mode.

The texture image can be represented by the same data formats as the pixels in a **glDrawPixels** command, except that **GL_STENCIL_INDEX** and **GL_DEPTH_COMPONENT** cannot be used. **glPixelStore** and **glPixelTransfer** modes affect texture images in exactly the way they affect **glDrawPixels**.

A texture image with zero height or width indicates the null texture. If the null texture is specified for level-of-detail 0, it is as if texturing were disabled.

ERRORS

GL_INVALID_ENUM is generated when *target* is not **GL_TEXTURE_2D**.

GL_INVALID_ENUM is generated when *format* is not an accepted *format* constant. Format constants other than **GL_STENCIL_INDEX** and **GL_DEPTH_COMPONENT** are accepted.

GL_INVALID_ENUM is generated when *type* is not a *type* constant.

GL_INVALID_ENUM is generated if *type* is **GL_BITMAP** and *format* is not **GL_COLOR_INDEX**.

GL_INVALID_VALUE is generated if *level* is less than zero or greater than ld(*max*) where *max* is the returned value of **GL_MAX_TEXTURE_SIZE**.

GL_INVALID_VALUE is generated if *components* is not 1, 2, 3, or 4.

GL_INVALID_VALUE is generated if *width* or *height* is less than zero or greater than 2 + **GL_MAX_TEXTURE_SIZE**, or if it cannot be represented as 2^k + 2 * (*border*) for some integer value of *k*.

GL_INVALID_VALUE is generated if *border* is not 0 or 1.

GL_INVALID_OPERATION is generated if **glTexImage2D** is executed between the execution of **glBegin** and the corresponding execution of **glEnd**.

glTexImage1D

NAME

glTexImage1D -- specify a one-dimensional texture image

C SPECIFICATION

```
void glTexImage1D(GLenum target,
                  GLint level,
                  GLint components,
                  GLsizei width,
                  GLint border,
                  GLenum format,
                  GLenum type,
                  const GLvoid *pixels)
```

PARAMETERS

target
: Specifies the target texture. Must be **GL_TEXTURE_1D**.

level
: Specifies the level-of-detail number. Level 0 is the base image level. Level *n* is the *n*th mipmap reduction image.

components
: Specifies the number of color components in the texture. Must be 1, 2, 3, or 4.

width
: Specifies the width of the texture image. Must be $2^n + 2 * (border)$ for some integer *n*. The height of the texture image is 1.

border
: Specifies the width of the border. Must be either 0 or 1.

format
: Specifies the format of the pixel data. The following symbolic values are accepted: **GL_COLOR_INDEX**, **GL_RED**, **GL_GREEN**, **GL_BLUE**, **GL_ALPHA**, **GL_RGB**, **GL_RGBA**, **GL_LUMINANCE**, and **GL_LUMINANCE_ALPHA**.

type
: Specifies the data type of the pixel data. The following symbolic values are accepted: **GL_UNSIGNED_BYTE**, **GL_BYTE**, **GL_BITMAP**, **GL_UNSIGNED_SHORT**, **GL_SHORT**, **GL_UNSIGNED_INT**, **GL_INT**, and **GL_FLOAT**.

pixels
: Specifies a pointer to the image data in memory.

DESCRIPTION

Texturing maps a portion of a specified *texture image* onto each graphical primitive for which texturing is enabled. One-dimensional texturing is enabled and disabled using **glEnable** and **glDisable** with argument **GL_TEXTURE_1D**.

Texture images are defined with **glTexImage1D**. The arguments describe the parameters of the texture image, such as width, width of the border, level-of-detail number (see **glTexParameter**), and number of color componenents provided. The last three arguments describe the way the image is represented in memory, and they are identical to the pixel formats used for **glDrawPixels**.

Data is read from *pixels* as a sequence of signed or unsigned bytes, shorts, or longs, or single-precision floating-point values, depending on *type*. These values are grouped into sets of one, two, three, or four values, depending on *format*, to form an element. If *type* is **GL_BITMAP**, the data is considered as a string of unsigned bytes (and *format* must be **GL_COLOR_INDEX**). Each data byte is treated as eight 1-bit elements, with bit ordering determined by **GL_UNPACK_LSB_FIRST** (see **glPixelStore**).

format determines the composition of each element in *pixels* and selects the target frame buffer. It can assume one of nine symbolic values:

GL_COLOR_INDEX
: Each element is a single value, a color index. It is converted to fixed point (with an unspecified number of zero bits to the right of the binary point), shifted left or right depending on the value and sign of **GL_INDEX_SHIFT**, and added to **GL_INDEX_OFFSET** (see **glPixelTransfer**). The resulting index is converted to a set of color components using the **GL_PIXEL_MAP_I_TO_R**, **GL_PIXEL_MAP_I_TO_G**, **GL_PIXEL_MAP_I_TO_B**, and **GL_PIXEL_MAP_I_TO_A** tables, and clamped to the range [0, 1].

GL_RED
: Each element is a single red component. It is converted to floating point and assembled into an RGBA element by attaching 0.0 for green and blue, and 1.0 for alpha. Each component is then multiplied by the signed scale factor **GL_c_SCALE**, added to the signed bias **GL_c_BIAS**, and clamped to the range [0, 1] (see **glPixelTransfer**).

GL_GREEN
: Each element is a single green component. It is converted to floating point and assembled into an RGBA element by attaching 0.0 for red and blue, and 1.0 for alpha. Each component is then multiplied by the signed scale factor **GL_c_SCALE**, added to the signed bias **GL_c_BIAS**, and clamped to the range [0, 1] (see **glPixelTransfer**).

GL_BLUE
: Each element is a single blue component. It is converted to floating point and assembled into an RGBA element by attaching 0.0 for red and green, and 1.0 for alpha. Each component is then multiplied by the signed scale factor **GL_c_SCALE**, added to the signed bias **GL_c_BIAS**, and clamped to the range [0, 1] (see **glPixelTransfer**).

GL_ALPHA
: Each element is a single alpha component. It is converted to floating point and assembled into an RGBA element by attaching 0.0 for red, green and blue. Each component is then multiplied by the signed scale factor **GL_c_SCALE**, added to the signed bias **GL_c_BIAS**, and clamped to the range [0, 1] (see **glPixelTransfer**).

GL_RGB
: Each element is an RGB triple. It is converted to floating point and assembled into an RGBA element by attaching 1.0 for alpha. Each component is then multiplied by the signed scale factor **GL_c_SCALE**, added to the signed bias **GL_c_BIAS**, and clamped to the range [0, 1] (see **glPixelTransfer**).

GL_RGBA,
: Each element contains all four components. Each component is multiplied by the signed scale factor **GL_c_SCALE**, added to the signed bias **GL_c_BIAS**, and clamped to the range [0, 1] (see **glPixelTransfer**).

GL_LUMINANCE
: Each element is a single luminance value. It is converted to floating point, then assembled into an RGBA

element by replicating the luminance value three times for red, green, and blue and attaching 1.0 for alpha. Each component is then multiplied by the signed scale factor **GL_c_SCALE**, added to the signed bias **GL_c_BIAS**, and clamped to the range [0, 1] (see **glPixelTransfer**).

GL_LUMINANCE_ALPHA
Each element is a luminance/alpha pair. It is converted to floating point, then assembled into an RGBA element by replicating the luminance value three times for red, green, and blue. Each component is then multiplied by the signed scale factor **GL_c_SCALE**, added to the signed bias **GL_c_BIAS**, and clamped to the range [0, 1] (see **glPixelTransfer**).

A texture image can have up to four components per texture element, depending on *components*. A one-component texture image uses only the red component of the RGBA color extracted from *pixels*. A two-component image uses the R and A values. A three-component image uses the R, G, and B values. A four-component image uses all of the RGBA components

NOTES

Texturing has no effect in color index mode.

The texture image can be represented by the same data formats as the pixels in a **glDrawPixels** command, except that **GL_STENCIL_INDEX** and **GL_DEPTH_COMPONENT** cannot be used. **glPixelStore** and **glPixelTransfer** modes affect texture images in exactly the way they affect **glDrawPixels**.

A texture image with zero width indicates the null texture. If the null texture is specified for level-of-detail 0, it is as if texturing were disabled.

ERRORS

GL_INVALID_ENUM is generated when *target* is not **GL_TEXTURE_1D**.

GL_INVALID_ENUM is generated when *format* is not an accepted *format* constant. Format constants other than **GL_STENCIL_INDEX** and **GL_DEPTH_COMPONENT** are accepted.

GL_INVALID_ENUM is generated when *type* is not a *type* constant.

GL_INVALID_ENUM is generated if *type* is **GL_BITMAP** and *format* is not **GL_COLOR_INDEX**.

GL_INVALID_VALUE is generated if *level* is less than zero or greater than ld(*max*) where *max* is the returned value of **GL_MAX_TEXTURE_SIZE**.

GL_INVALID_VALUE is generated if *components* is not 1, 2, 3, or 4.

GL_INVALID_VALUE is generated if *width* is less than zero or greater than 2 + **GL_MAX_TEXTURE_SIZE**, or if it cannot be represented as 2^n + 2 * (*border*) for some integer value of *n*.

GL_INVALID_VALUE is generated if *border* is not 0 or 1.

GL_INVALID_OPERATION is generated if **glTexImage1D** is executed between the execution of **glBegin** and the corresponding execution of **glEnd**.

glTranslate

NAME

glTranslated, **glTranslatef** -- multiply the current matrix by a translation matrix

C SPECIFICATION

```
void glTranslated(GLdouble x,
                  GLdouble y,
                  GLdouble z)
void glTranslatef(GLfloat x,
                  GLfloat y,
                  GLfloat z)
```

PARAMETERS

x, *y*, *z*
Specify the *x*, *y*, and *z* coordinates of a translation vector.

DESCRIPTION

glTranslate moves the coordinate system origin to the point specified by (*x*, *y*, *z*). The translation vector is used to compute a 4x4 translation matrix:

$$\begin{pmatrix} 1 & 0 & 0 & x \\ 0 & 1 & 0 & y \\ 0 & 0 & 1 & z \\ 0 & 0 & 0 & 1 \end{pmatrix}$$

The current matrix (see **glMatrixMode**) is multiplied by this translation matrix, with the product replacing the current matrix. That is, if M is the current matrix and T is the translation matrix, then M is replaced with M * T.

If the matrix mode is either **GL_MODELVIEW** or **GL_PROJECTION**, all objects drawn after **glTranslate** is called are translated. Use **glPushMatrix** and **glPopMatrix** to save and restore the untranslated coordinate system.

ERRORS

GL_INVALID_OPERATION is generated if **glTranslate** is executed between the execution of **glBegin** and the corresponding execution of **glEnd**.

glTexParameter

NAME

glTexParameterf, **glTexParameteri**, **glTexParameterfv**, **glTexParameteriv** -- set texture parameters

C SPECIFICATION

```
void glTexParameterf(GLenum target,
                     GLenum pname,
                     GLfloat param)
void glTexParameteri(GLenum target,
                     GLenum pname,
                     GLint param)
```

PARAMETERS

target
: Specifies the *target* texture, which must be either **GL_TEXTURE_1D**, or **GL_TEXTURE_2D**.

pname
: Specifies the symbolic name of a single-valued texture parameter. *pname* can be one of the following: **GL_TEXTURE_MIN_FILTER**, **GL_TEXTURE_MAG_FILTER**, **GL_TEXTURE_WRAP_S**, or **GL_TEXTURE_WRAP_T**.

param
: Specifies the value of *pname*.

C SPECIFICATION

```
void glTexParameterfv(GLenum target,
                      GLenum pname,
                      const GLfloat *params)
void glTexParameteriv(GLenum target,
                      GLenum pname,
                      const GLint *params)
```

PARAMETERS

target
: Specifies the *target* texture, which must be either **GL_TEXTURE_1D**, or **GL_TEXTURE_2D**.

pname
: Specifies the symbolic name of a texture parameter. *pname* can be one of the following: **GL_TEXTURE_MIN_FILTER**, **GL_TEXTURE_MAG_FILTER**, **GL_TEXTURE_WRAP_S**, **GL_TEXTURE_WRAP_T**, or **GL_TEXTURE_BORDER_COLOR**.

params
: Specifies a pointer to an array where the value or values of *pname* are stored.

DESCRIPTION

Texture mapping is a technique that applies an image onto an object's surface as if the image were a decal or cellophane shrink-wrap. The image is created in texture space, with an (s, t) coordinate system. A texture is a one-, or two-dimensional image and a set of parameters that determine how samples are derived from the image.

glTexParameter assigns the value or values in *params* to the texture parameter specified as *pname*. *target* defines the target texture, either **GL_TEXTURE_1D**, or **GL_TEXTURE_2D**. The following symbols are accepted in *pname*:

GL_TEXTURE_MIN_FILTER

The texture minifying function is used whenever the pixel being textured maps to an area greater than one texture element. There are six defined minifying functions. Two of them use the nearest one or nearest four texture elements to compute the texture value. The other four use mipmaps.

A mipmap is an ordered set of arrays representing the same image at progressively lower resolutions. If the texture has dimensions $2^n * 2^m$ there are max(n, m) + 1 mipmaps. The first mipmap is the original texture, with dimensions $2^n * 2^m$. Each subsequent mipmap has dimensions $2^{(k - 1)} * 2^{(l - 1)}$ where $2^k * 2^l$ are the dimensions of the previous mipmap, until either k = 0 or l = 0. At that point, subsequent mipmaps have dimension $1 * 2^{(l - 1)}$ or $2^{(k - 1)} * 1$ until the final mipmap, which has dimension 1 * 1. Mipmaps are defined using **glTexImage1D** or **glTexImage2D** or with the level-of-detail argument indicating the order of the mipmaps. Level 0 is the original texture; level max(n, m) is the final 1 * 1 mipmap.

params supplies a function for minifying the texture as one of the following:

GL_NEAREST

Returns the value of the texture element that is nearest (in Manhattan distance) to the center of the pixel being textured.

GL_LINEAR

Returns the weighted average of the four texture elements that are closest to the center of the pixel being textured. These can include border texture elements, depending on the values of **GL_TEXTURE_WRAP_S** and **GL_TEXTURE_WRAP_T**, and on the exact mapping.

GL_NEAREST_MIPMAP_NEAREST

Chooses the mipmap that most closely matches the size of the pixel being textured and uses the **GL_NEAREST** criterion (the texture element nearest to the center of the pixel) to produce a texture value.

GL_LINEAR_MIPMAP_NEAREST

Chooses the mipmap that most closely matches the size of the pixel being textured and uses the **GL_LINEAR** criterion (a weighted average of the four texture elements that are closest to the center of the pixel) to produce a texture value.

GL_NEAREST_MIPMAP_LINEAR

Chooses the two mipmaps that most closely match the size of the pixel being textured and uses the **GL_NEAREST** criterion (the texture element nearest to the center of the pixel) to produce a texture value from each mipmap. The final texture value is a weighted average of those two values.

GL_LINEAR_MIPMAP_LINEAR

Chooses the two mipmaps that most closely match the size of the pixel being textured and uses the **GL_LINEAR** criterion (a weighted average of the four texture elements that are closest to the center of the pixel) to produce a texture value from each mipmap. The final texture value is a weighted average of those two values.

As more texture elements are sampled in the minification process, fewer aliasing artifacts will be apparent. While the **GL_NEAREST** and **GL_LINEAR** minification functions can be faster than the other four, they sample only one or four texture elements to determine the texture value of the pixel being rendered and can produce moire patterns or ragged transitions. The default value of **GL_TEXTURE_MIN_FILTER** is **GL_NEAREST_MIPMAP_LINEAR**.

GL_TEXTURE_MAG_FILTER

The texture magnification function is used when the pixel being textured maps to an area less than or equal to one texture element. It sets the texture magnification function to any of the following:

GL_NEAREST

Returns the value of the texture element that is nearest (in Manhattan distance) to the center of the pixel being textured.

GL_LINEAR

Returns the weighted average of the four texture elements that are closest to the center of the pixel being textured. These can include border texture elements, depending on the values of **GL_TEXTURE_WRAP_S** and **GL_TEXTURE_WRAP_T**, and on the exact mapping.

GL_NEAREST is generally faster than **GL_LINEAR**, but it can produce textured images with sharper edges because the transition between texture elements is not as smooth. The default value of **GL_TEXTURE_MAG_FILTER** is **GL_LINEAR**.

GL_TEXTURE_WRAP_S

Sets the wrap parameter for texture coordinate *s* to either **GL_CLAMP** or **GL_REPEAT**. **GL_CLAMP** causes *s* coordinates to be clamped to the range [0, 1] and is useful for preventing wrapping artifacts when mapping a single image onto an object. **GL_REPEAT** causes the integer part of the *s* coordinate to be ignored; the GL uses only the fractional part, thereby creating a repeating pattern. Border texture elements are accessed only if wrapping is set to **GL_CLAMP**. Initially, **GL_TEXTURE_WRAP_S** is set to **GL_REPEAT**.

GL_TEXTURE_WRAP_T

Sets the wrap parameter for texture coordinate *t* to either **GL_CLAMP** or **GL_REPEAT**. See the discussion under **GL_TEXTURE_WRAP_S**. Initially, **GL_TEXTURE_WRAP_T** is set to **GL_REPEAT**.

GL_TEXTURE_BORDER_COLOR

Sets a border color. *params* contains four values that comprise the RGBA color of the texture border. Integer color components are interpreted linearly such that the most positive integer maps to 1.0, and the most negative integer maps to -1.0. The values are clamped to the range [0, 1] when they are specified. Initially, the border color is (0, 0, 0, 0).

NOTES

Suppose texturing is enabled (by calling **glEnable** with argument **GL_TEXTURE_1D**, or **GL_TEXTURE_2D**) and **GL_TEXTURE_MIN_FILTER** is set to one of the functions that requires a mipmap. If either the dimensions of the texture images currently defined (with previous calls to **glTexImage1D**, or **glTexImage2D**) do not follow the proper sequence for mipmaps (described above), or there are fewer texture images defined than are needed, or the set of texture images have differing numbers of texture components, then it is as if texture mapping were disabled.

Linear filtering accesses the four nearest texture elements only in 2D textures. In 1D textures, linear filtering accesses the two nearest texture elements.

ERRORS

GL_INVALID_ENUM is generated when *target* or *pname* is not one of the accepted defined values, or when *params* should have a defined constant value (based on the value of *pname*) and does not.

GL_INVALID_OPERATION is generated if **glTexParameter** is executed between the execution of **glBegin** and the corresponding execution of **glEnd**.

glViewport

NAME

glViewport -- set the viewport

C SPECIFICATION

```
void glViewport(GLint x,
                GLint y,
                GLsizei width,
                GLsizei height)
```

PARAMETERS

x, *y*
: Specify the lower left corner of the viewport rectangle, in pixels. The default is (0, 0).

width, *height*
: Specify the width and height, respectively, of the viewport. When a GL context is *first* attached to a window, *width* and *height* are set to the dimensions of that window.

DESCRIPTION

glViewport specifies the affine transformation of *x* and *y* from normalized device coordinates to window coordinates. Let (*xnd*, *ynd*) be normalized device coordinates. Then the window coordinates (*xw*, *yw*) are computed as follows:

$$x_w = (x_{nd} + 1)\left(\frac{width}{2}\right) + x$$

$$y_w = (y_{nd} + 1)\left(\frac{height}{2}\right) + y$$

Viewport width and height are silently clamped to a range that depends on the implementation. This range is queried by calling glGet with argument **GL_MAX_VIEWPORT_DIMS**.

ERRORS

GL_INVALID_VALUE is generated if either *width* or *height* is negative.

GL_INVALID_OPERATION is generated if **glViewport** is executed between the execution of glBegin and the corresponding execution of glEnd.

ASSOCIATED GETS

glGet with argument **GL_VIEWPORT**
glGet with argument **GL_MAX_VIEWPORT_DIMS**

                GLshort z)
void glVertex4d(GLdouble x,
                GLdouble y,
                GLdouble z,
                GLdouble w)
void glVertex4f(GLfloat x,
                GLfloat y,
                GLfloat z,
                GLfloat w)
void glVertex4i(GLint x,
                GLint y,
                GLint z,
                GLint w)
void glVertex4s(GLshort x,
                GLshort y,
                GLshort z,
                GLshort w)
```

PARAMETERS

x, *y*, *z*, *w*
: Specify *x*, *y*, *z*, and *w* coordinates of a vertex. Not all parameters are present in all forms of the command.

C SPECIFICATION

```
void glVertex2dv(const GLdouble *v)
void glVertex2fv(const GLfloat *v)
void glVertex2iv(const GLint *v)
void glVertex2sv(const GLshort *v)
void glVertex3dv(const GLdouble *v)
void glVertex3fv(const GLfloat *v)
void glVertex3iv(const GLint *v)
void glVertex3sv(const GLshort *v)
void glVertex4dv(const GLdouble *v)
void glVertex4fv(const GLfloat *v)
void glVertex4iv(const GLint *v)
```

```
void glVertex4sv(const GLshort *v)
```

PARAMETERS

v

Specifies a pointer to an array of two, three, or four elements. The elements of a two-element array are *x* and *y*; of a three-element array, *x*, *y*, and *z*; and of a four-element array, *x*, *y*, *z*, and *w*.

DESCRIPTION

glVertex commands are used within **glBegin** / **glEnd** pairs to specify point, line, and polygon vertices. The current color, normal, and texture coordinates are associated with the vertex when **glVertex** is called.

When only *x* and *y* are specified, *z* defaults to 0.0 and *w* defaults to 1.0. When *x*, *y*, and *z* are specified, *w* defaults to 1.0.

NOTES

Invoking **glVertex** outside of a **glBegin** / **glEnd** pair results in undefined behavior.

glXCopyContext

NAME

glXCopyContext -- copy state from one rendering context to another

C SPECIFICATION

```
void glXCopyContext(Display *dpy,
                    GLXContext src,
                    GLXContext dst,
                    GLuint mask)
```

PARAMETERS

dpy
: Specifies the connection to the X server.

src
: Specifies the source context.

dst
: Specifies the destination context.

mask
: Specifies which portions of *src* state are to be copied to *dst*.

DESCRIPTION

glXCopyContext copies selected groups of state variables from *src* to *dst*. *mask* indicates which groups of state variables are to be copied. *mask* contains the bitwise OR of the same symbolic names that are passed to the OpenGL command **glPushAttrib**. The single symbolic constant **GL_ALL_ATTRIB_BITS** can be used to copy the maximum possible portion of rendering state.

The copy can be done only if the renderers named by *src* and *dst* share an address space. Two rendering contexts share an address space if both are nondirect using the same server, or if both are direct and owned by a single process. Note that in the nondirect case it is not necessary for the calling threads to share an address space, only for their related rendering contexts to share an address space.

Not all values for OpenGL state can be copied. For example, pixel pack and unpack state, render mode state, and select and feedback state are not copied. The state that can be copied is exactly the state that is manipulated by OpenGL command **glPushAttrib**.

If *src* is not the current context for the thread issuing the request, then the state of the *src* context is undefined.

NOTES

Two rendering contexts share an address space if both are nondirect using the same server, or if both are direct and owned by a single process.

A *process* is a single execution environment, implemented in a single address space, consisting of one or more threads.

A *thread* is one of a set of subprocesses that share a single address space, but maintain separate program counters, stack spaces, and other related global data. A thread that is the only member of its subprocess group is equivalent to a *process*.

ERRORS

BadMatch is generated if rendering contexts *src* and *dst* do not share an address space or were not created with respect to the same screen.

BadAccess is generated if *dst* is current to any thread (including the calling thread) at the time **glXCopyContext** is called.

GLX_BAD_CURRENT_WINDOW is generated if *src* is the current context and the current drawable is a window that is no longer valid.

GLX_BAD_CONTEXT is generated if either *src* or *dst* is not a valid GLX context.

BadValue is generated if undefined *mask* bits are specified.

SEE ALSO

glPushAttrib, **glXCreateContext**, **glXIsDirect**,

glXChooseVisual

NAME

glXChooseVisual -- return a visual that matches specified attributes

C SPECIFICATION

```
XVisualInfo* glXChooseVisual(Display *dpy,
                             int screen,
                             int *attribList)
```

PARAMETERS

dpy
: Specifies the connection to the X server.

screen
: Specifies the screen number.

attribList
: Specifies a list of Boolean attributes and integer attribute/value pairs. The last attribute must be **None**.

DESCRIPTION

glXChooseVisual returns a pointer to an XVisualInfo structure describing the visual that best meets a minimum specification. The Boolean GLX attributes of the visual that is returned will match the specified values, and the integer GLX attributes will meet or exceed the specified minimum values. If all other attributes are equivalent, then TrueColor and PseudoColor visuals have priority over DirectColor and StaticColor visuals, respectively. If no conforming visual exists, **NULL** is returned. To free the data returned by this function, use **XFree**.

All Boolean GLX attributes default to **False** except **GLX_USE_GL**, which defaults to **True**. All integer GLX attributes default to zero. Default specifications are superseded by attributes included in *attribList*. Boolean attributes included in *attribList* are understood to be **True**. Integer attributes are followed immediately by the corresponding desired or minimum value. The list must be terminated with **None**.

The interpretations of the various GLX visual attributes are as follows:

GLX_USE_GL
: Ignored. Only visuals that can be rendered with GLX are considered.

GLX_BUFFER_SIZE
: Must be followed by a nonnegative integer thatindicates the desired color index buffer size. The smallest index buffer of at least the specified size is preferred. Ignored if **GLX_RGBA** is asserted.

GLX_LEVEL
: Must be followed by an integer buffer-level specification. This specification is honored exactly. Buffer level zero corresponds to the default frame buffer of the display. Buffer level one is the first overlay frame buffer, level two the second overlay frame buffer, and so on. Negative buffer levels correspond to underlay frame buffers.

GLX_RGBA
: If present, only TrueColor and DirectColor visuals are considered. Otherwise, only PseudoColor and StaticColor

visuals are considered.

GLX_DOUBLEBUFFER
If present, only double-buffered visuals are considered. Otherwise, only single-buffered visuals are considered.

GLX_STEREO
If present, only stereo visuals are considered. Otherwise, only monoscopic visuals are considered.

GLX_AUX_BUFFERS
Must be followed by a nonnegative integer that indicates the desired number of auxiliary buffers. Visuals with the smallest number of auxiliary buffers that meets or exceeds the specified number are preferred.

GLX_RED_SIZE
Must be followed by a nonnegative minimum size specification. If this value is zero, the smallest available red buffer is preferred. Otherwise, the largest available red buffer of at least the minimum size is preferred.

GLX_GREEN_SIZE
Must be followed by a nonnegative minimum size specification. If this value is zero, the smallest available green buffer is preferred. Otherwise, the largest available green buffer of at least the minimum size is preferred.

GLX_BLUE_SIZE
Must be followed by a nonnegative minimum size specification. If this value is zero, the smallest available blue buffer is preferred. Otherwise, the largest available blue buffer of at least the minimum size is preferred.

GLX_ALPHA_SIZE
Must be followed by a nonnegative minimum size specification. If this value is zero, the smallest available alpha buffer is preferred. Otherwise, the largest available alpha buffer of at least the minimum size is preferred.

GLX_DEPTH_SIZE
Must be followed by a nonnegative minimum size specification. If this value is zero, visuals with no depth buffer are preferred. Otherwise, the largest available depth buffer of at least the minimum size is preferred.

GLX_STENCIL_SIZE
Must be followed by a nonnegative integer that indicates the desired number of stencil bitplanes. The smallest stencil buffer of at least the specified size is preferred. If the desired value is zero, visuals with no stencil buffer are preferred.

GLX_ACCUM_RED_SIZE
Must be followed by a nonnegative minimum size specification. If this value is zero, visuals with no red accumulation buffer are preferred. Otherwise, the largest possible red accumulation buffer of at least the minimum size is preferred.

GLX_ACCUM_GREEN_SIZE
Must be followed by a nonnegative minimum size specification. If this value is zero, visuals with no green accumulation buffer are preferred. Otherwise, the largest possible green accumulation buffer of at least the minimum size is preferred.

GLX_ACCUM_BLUE_SIZE
Must be followed by a nonnegative minimum size specification. If this value is zero, visuals with no blue accumulation buffer are preferred. Otherwise, the largest possible blue accumulation buffer of at least the minimum size is preferred.

GLX_ACCUM_ALPHA_SIZE
Must be followed by a nonnegative minimum size specification. If this value is zero, visuals with no alpha accumulation buffer are preferred. Otherwise, the largest possible alpha accumulation buffer of at least the

minimum size is preferred.

EXAMPLES

```
attribList =
            {GLX_RGBA, GLX_RED_SIZE, 4, GLX_GREEN_SIZE, 4,
             GLX_BLUE_SIZE, 4, None};
```

Specifies a single-buffered RGB visual in the normal frame buffer, not an overlay or underlay buffer. The returned visual supports at least four bits each of red, green, and blue, and possibly no bits of alpha. It does not support color index mode, double-buffering, or stereo display. It may or may not have one or more auxiliary color buffers, a depth buffer, a stencil buffer, or an accumulation buffer.

NOTES

XVisualInfo is defined in *Xutil.h*. It is a structure that includes *visual*, *visualID*, *screen*, and *depth* elements.

glXChooseVisual is implemented as a client-side utility using only **XGetVisualInfo** and **glXGetConfig**. Calls to these two routines can be used to implement selection algorithms other than the generic one implemented by **glXChooseVisual**.

GLX implementers are strongly discouraged, but not proscribed, from changing the selection algorithm used by **glXChooseVisual**. Therefore, selections may change from release to release of the client-side library.

There is no direct filter for picking only visuals that support GLXPixmaps. GLXPixmaps are supported for visuals whose **GLX_BUFFER_SIZE** is one of the Pixmap depths supported by the X server.

ERRORS

NULL is returned if an undefined GLX attribute is encountered in *attribList*.

SEE ALSO

glXCreateContext, **glXGetConfig**

---

---

glXCreateGLXPixmap

NAME

glXCreateGLXPixmap -- create an off-screen GLX rendering area

C SPECIFICATION

```
GLXPixmap glXCreateGLXPixmap(Display *dpy,
                             XVisualInfo *vis,
                             Pixmap pixmap)
```

PARAMETERS

dpy
: Specifies the connection to the X server.

vis
: Specifies the visual that defines the structure of the rendering area. It is a pointer to an **XVisualInfo** structure, not a visual ID or a pointer to a Visual.

pixmap
: Specifies the X pixmap that will be used as the front left color buffer of the off-screen rendering area.

DESCRIPTION

glXCreateGLXPixmap creates an off-screen rendering area and returns its XID. Any GLX rendering context that was created with respect to vis can be used to render into this off-screen area. Use **glXMakeCurrent** to associate the rendering area with a GLX rendering context.

The X pixmap identified by *pixmap* is used as the front left buffer of the resulting off-screen rendering area. All other buffers specified by *vis*, including color buffers other than the front left buffer, are created without externally visible names. GLX pixmaps with double-buffering are supported. However, **glXSwapBuffers** is ignored by these pixmaps.

Direct rendering contexts cannot be used to render into GLX pixmaps.

NOTES

XVisualInfo is defined in *Xutil.h*. It is a structure that includes *visual*, *visualID*, *screen*, and *depth* elements.

ERRORS

BadMatch is generated if the depth of *pixmap* does not match the **GLX_BUFFER_SIZE** value of *vis*, or if *pixmap* was not created with respect to the same screen as *vis*.

BadValue is generated if *vis* is not a valid **XVisualInfo** pointer (e.g., if the GLX implementation does not support this visual).

BadPixmap is generated if *pixmap* is not a valid pixmap.

BadAlloc is generated if the server cannot allocate the GLX pixmap.

SEE ALSO

glXCreateContext, **glXIsDirect**, **glXMakeCurrent**

---

back to the **OpenGL index page**

---

glXCreateContext

NAME

glXCreateContext -- create a new GLX rendering context

C SPECIFICATION

```
GLXContext glXCreateContext(Display *dpy,
                            XVisualInfo *vis,
                            GLXContext shareList,
                            Bool direct)
```

PARAMETERS

dpy
: Specifies the connection to the X server.

vis
: Specifies the visual that defines the frame buffer resources available to the rendering context. It is a pointer to an **XVisualInfo** structure, not a visual ID or a pointer to a **Visual**.

shareList
: Specifies the context with which to share display lists. **NULL** indicates that no sharing is to take place.

direct
: Specifies whether rendering is to be done with a direct connection to the graphics system if possible (**True**) or through the X server (**False**).

DESCRIPTION

glXCreateContext creates a GLX rendering context and returns its handle. This context can be used to render into both windows and GLX pixmaps. If **glXCreateContext** fails to create a rendering context, **NULL** is returned.

If *direct* is **True**, then a direct rendering context is created if the implementation supports direct rendering and the connection is to an X server that is local. If *direct* is **False**, then a rendering context that renders through the X server is always created. Direct rendering provides a performance advantage in some implementations. However, direct rendering contexts cannot be shared outside a single process, and they cannot be used to render to GLX pixmaps.

If *shareList* is not **NULL**, then all display-list indexes and definitions are shared by context *shareList* and by the newly created context. An arbitrary number of contexts can share a single display-list space. However, all rendering contexts that share a single display-list space must themselves exist in the same address space. Two rendering contexts share an address space if both are nondirect using the same server, or if both are direct and owned by a single process. Note that in the nondirect case, it is not necessary for the calling threads to share an address space, only for their related rendering contexts to share an address space.

NOTES

XVisualInfo is defined in *Xutil.h*. It is a structure that includes *visual*, *visualID*, *screen*, and *depth* elements.

A *process* is a single execution environment, implemented in a single address space, consisting of one or more threads.

A *thread* is one of a set of subprocesses that share a single address space, but maintain separate program counters, stack spaces, and other related global data. A *thread* that is the only member of its subprocess group is equivalent to a *process*.

ERRORS

NULL is returned if execution fails on the client side.

BadMatch is generated if the context to be created would not share the address space of the context specified by *shareList* or if the specified visual is not available.

BadValue is generated if *vis* specifies an invalid screen number.

GLX_BAD_CONTEXT is generated if *shareList* is not a GLX context and is not **NULL**.

BadAlloc is generated if the server does not have enough resources to allocate the new context.

glXDestroyGLXPixmap

NAME

glXDestroyGLXPixmap -- destroy a GLX pixmap

C SPECIFICATION

```
void glXDestroyGLXPixmap(Display *dpy,
                         GLXPixmap pix)
```

PARAMETERS

dpy
: Specifies the connection to the X server.

pix
: Specifies the GLX pixmap to be destroyed.

DESCRIPTION

If GLX pixmap *pix* is not current to any client, **glXDestroyGLXPixmap** destroys it immediately. Otherwise, *pix* is destroyed when it becomes not current to any client. In either case, the resource ID is freed immediately.

ERRORS

GLX_BAD_PIXMAP is generated if *pix* is not a valid GLX pixmap.

glXDestroyContext

NAME

glXDestroyContext -- destroy a GLX context

C SPECIFICATION

```
void glXDestroyContext(Display *dpy,
                       GLXContext ctx)
```

PARAMETERS

dpy
: Specifies the connection to the X server.

ctx
: Specifies the GLX context to be destroyed.

DESCRIPTION

If GLX rendering context *ctx* is not current to any thread, **glXDestroyContext** destroys it immediately. Otherwise, *ctx* is destroyed when it becomes not current to any thread. In either case, the resource ID referenced by *ctx* is freed immediately.

ERRORS

GLX_BAD_CONTEXT is generated if *ctx* is not a valid GLX context.

glXGetCurrentContext

NAME

glXGetCurrentContext -- return the current context

C SPECIFICATION

```
GLXContext glXGetCurrentContext(void void)
```

DESCRIPTION

glXGetCurrentContext returns the current context, as specified by **glXMakeCurrent**. If there is no current context, **NULL** is returned.

glXGetCurrentContext returns client-side information. It does not make a round trip to the server.

SEE ALSO

glXCreateContext, **glXMakeCurrent**

---

back to the **OpenGL index page**

---

glXGetConfig

NAME

glXGetConfig -- return information about GLX visuals

C SPECIFICATION

```
int glXGetConfig(Display *dpy,
                 XVisualInfo *vis,
                 int attrib,
                 int *value)
```

PARAMETERS

dpy
: Specifies the connection to the X server.

vis
: Specifies the visual to be queried. It is a pointer to an **XVisualInfo** structure, not a visual ID or a pointer to a **Visual**.

attrib
: Specifies the visual attribute to be returned.

value
: Returns the requested value.

DESCRIPTION

glXGetConfig sets *value* to the *attrib* value of windows or GLX pixmaps created with respect to *vis*. **glXGetConfig** returns an error code if it fails for any reason. Otherwise, zero is returned.

attrib is one of the following:

GLX_USE_GL
: **True** if OpenGL rendering is supported by this visual, **False** otherwise.

GLX_BUFFER_SIZE
: Number of bits per color buffer. For RGBA visuals, **GLX_BUFFER_SIZE** is the sum of **GLX_RED_SIZE**, **GLX_GREEN_SIZE**, **GLX_BLUE_SIZE**, and **GLX_ALPHA_SIZE**. For color index visuals, **GLX_BUFFER_SIZE** is the size of the color indexes.

GLX_LEVEL
: Frame buffer level of the visual. Level zero is the default frame buffer. Positive levels correspond to frame buffers that overlay the default buffer, and negative levels correspond to frame buffers that underlay the default buffer.

GLX_RGBA
: **True** if color buffers store red, green, blue, and alpha values, **False** if they store color indexes.

GLX_DOUBLEBUFFER
: **True** if color buffers exist in front/back pairs that can be swapped, **False** otherwise.

GLX_STEREO
True if color buffers exist in left/right pairs, **False** otherwise.

GLX_AUX_BUFFERS
Number of auxiliary color buffers that are available. Zero indicates that no auxiliary color buffers exist.

GLX_RED_SIZE
Number of bits of red stored in each color buffer. Undefined if **GLX_RGBA** is False.

GLX_GREEN_SIZE
Number of bits of green stored in each color buffer. Undefined if **GLX_RGBA** is False.

GLX_BLUE_SIZE
Number of bits of blue stored in each color buffer. Undefined if **GLX_RGBA** is False.

GLX_ALPHA_SIZE
Number of bits of alpha stored in each color buffer. Undefined if **GLX_RGBA** is False.

GLX_DEPTH_SIZE
Number of bits in the depth buffer.

GLX_STENCIL_SIZE
Number of bits in the stencil buffer.

GLX_ACCUM_RED_SIZE
Number of bits of red stored in the accumulation buffer.

GLX_ACCUM_GREEN_SIZE
Number of bits of green stored in the accumulation buffer.

GLX_ACCUM_BLUE_SIZE
Number of bits of blue stored in the accumulation buffer.

GLX_ACCUM_ALPHA_SIZE
Number of bits of alpha stored in the accumulation buffer.

The X protocol allows a single visual ID to be instantiated with different numbers of bits per pixel. Windows or GLX pixmaps that will be rendered with OpenGL, however, must be instantiated with a color buffer depth of **GLX_BUFFER_SIZE**.

Although a GLX implementation can export many visuals that support OpenGL rendering, it must support at least two. One is an RGBA visual with at least one color buffer, a stencil buffer of at least 1 bit, a depth buffer of at least 12 bits, and an accumulation buffer. Alpha bitplanes are optional in this visual. However, its color buffer size must be as great as that of the deepest **TrueColor**, **DirectColor**, **PseudoColor**, or **StaticColor** visual supported on level zero, and it must itself be made available on level zero.

The other required visual is a color index one with at least one color buffer, a stencil buffer of at least 1 bit, and a depth buffer of at least 12 bits. This visual must have as many color bitplanes as the deepest **PseudoColor** or **StaticColor** visual supported on level zero, and it must itself be made available on level zero.

Applications are best written to select the visual that most closely meets their requirements. Creating windows or GLX pixmaps with unnecessary buffers can result in reduced rendering performance as well as poor resource allocation.

NOTES

XVisualInfo is defined in *Xutil.h*. It is a structure that includes *visual*, *visualID*, *screen*, and *depth* elements.

ERRORS

GLX_NO_EXTENSION is returned if *dpy* does not support the GLX extension.

GLX_BAD_SCREEN is returned if the screen of *vis* does not correspond to a screen.

GLX_BAD_ATTRIB is returned if *attrib* is not a valid GLX attribute.

GLX_BAD_VISUAL is returned if *vis* doesn't support GLX and an attribute other than **GLX_USE_GL** is requested.

glXIntro

NAME

glXIntro -- Introduction to OpenGL in the X window system

OVERVIEW

OpenGL is a high-performance 3-D-oriented renderer. It is available in the X window system through the GLX extension. Use **glXQueryExtension** and **glXQueryVersion** to establish whether the GLX extension is supported by an X server, and if so, what version is supported.

GLX extended servers make a subset of their visuals available for OpenGL rendering. Drawables created with these visuals can also be rendered using the core X renderer and with the renderer of any other X extension that is compatible with all core X visuals.

GLX extends drawables with several buffers other than the standard color buffer. These buffers include back and auxiliary color buffers, a depth buffer, a stencil buffer, and a color accumulation buffer. Some or all are included in each X visual that supports OpenGL.

To render using OpenGL into an X drawable, you must first choose a visual that defines the required OpenGL buffers. **glXChooseVisual** can be used to simplify selecting a compatible visual. If more control of the selection process is required, use **XGetVisualInfo** and **glXGetConfig** to select among all the available visuals.

Use the selected visual to create both a GLX context and an X drawable. GLX contexts are created with **glXCreateContext**, and drawables are created ith either **XCreateWindow** or **glXCreateGLXPixmap**. Finally, bind the context and the drawable together using **glXMakeCurrent**. This context/drawable pair becomes the current context and current drawable, and it is used by all OpenGL commands until **glXMakeCurrent** is called with different arguments.

Both core X and OpenGL commands can be used to operate on the current drawable. The X and OpenGL command streams are not synchronized, however, except at explicitly created boundaries generated by calling **glXWaitGL**, **glXWaitX**, **XSync**, and **glFlush**.

EXAMPLES

Below is the minimum code required to create an RGBA-format, OpenGL-compatible X window and clear it to yellow. The code is correct, but it does not include any error checking. Return values *dpy*, *vi*, *cx*, *cmap*, and *win* should all be tested.

```
#include
#include
#include

static int attributeList[] = { GLX_RGBA, None };

static Bool WaitForNotify(Display *d, XEvent *e, char *arg) {
    return (e->type == MapNotify) && (e->xmap.window == (Window)arg);
}

int main(int argc, char **argv) {
    Display *dpy;
    XVisualInfo *vi;
    Colormap cmap;
    XSetWindowAttributes swa;
    Window win;
    GLXContext cx;
```

```
        XEvent event;

        /* get a connection */
         dpy = XOpenDisplay(0);

        /* get an appropriate visual */
        vi = glXChooseVisual(dpy, DefaultScreen(dpy), attributeList);

        /* create a GLX context */
        cx = glXCreateContext(dpy, vi, 0, GL_TRUE);

        /* create a color map */
        cmap = XCreateColormap(dpy, RootWindow(dpy, vi->screen),
                               vi->visual, AllocNone);

        /* create a window */
        swa.colormap = cmap;
        swa.border_pixel = 0;
        swa.event_mask = StructureNotifyMask;
        win = XCreateWindow(dpy, RootWindow(dpy, vi->screen), 0, 0, 100, 100,
                            0, vi->depth, InputOutput, vi->visual,
                            CWBorderPixel|CWColormap|CWEventMask, &swa);
        XMapWindow(dpy, win);
        XIfEvent(dpy, &event, WaitForNotify, (char*)win);

        /* connect the context to the window */
        glXMakeCurrent(dpy, win, cx);

        /* clear the buffer */
        glClearColor(1,1,0,1);
        glClear(GL_COLOR_BUFFER_BIT);
        glFlush();

        /* wait a while */
        sleep(10);
    }
```

NOTES

A color map must be created and passed to **XCreateWindow**. See the example code above.

A GLX context must be created and attached to an X drawable before OpenGL commands can be executed. OpenGL commands issued while no context/drawable pair is current are ignored.

Exposure events indicate that all buffers associated with the specified window may be damaged and should be repainted. Although certain buffers of some visuals on some systems may never require repainting (the depth buffer, for example), it is incorrect to code assuming that these buffers will not be damaged.

GLX commands manipulate XVisualInfo structures rather than pointers to visuals or visual IDs. XVisualInfo structures contain *visual*, *visualID*, *screen*, and *depth* elements, as well as other X-specific information.

glXGetCurrentDrawable

NAME

glXGetCurrentDrawable -- return the current drawable

C SPECIFICATION

```
GLXDrawable glXGetCurrentDrawable(void void)
```

DESCRIPTION

glXGetCurrentDrawable returns the current drawable, as specified by **glXMakeCurrent**. If there is no current drawable, **NULL** is returned.

glXGetCurrentDrawable returns client-side information. It does not make a round trip to the server.

SEE ALSO

glXCreateGLXPixmap, **glXMakeCurrent**

---

back to the **OpenGL index page**

---

glXMakeCurrent

NAME

glXMakeCurrent -- attach a GLX context to a window or a GLX pixmap

C SPECIFICATION

```
Bool glXMakeCurrent(Display *dpy,
                    GLXDrawable drawable,
                    GLXContext ctx)
```

PARAMETERS

dpy
: Specifies the connection to the X server.

drawable
: Specifies a GLX drawable. Must be either an X window ID or a GLX pixmap ID.

ctx
: Specifies a GLX rendering context that is to be attached to *drawable*.

DESCRIPTION

glXMakeCurrent does two things: It makes *ctx* the current GLX rendering context of the calling thread, replacing the previously current context if there was one, and it attaches *ctx* to a GLX drawable, either a window or a GLX pixmap. As a result of these two actions, subsequent OpenGL rendering calls use rendering context *ctx* to modify GLX drawable *drawable*. Because **glXMakeCurrent** always replaces the current rendering context with *ctx*, there can be only one current context per thread.

Pending commands to the previous context, if any, are flushed before it is released.

The first time *ctx* is made current to any thread, its viewport is set to the full size of *drawable*. Subsequent calls by any thread to **glXMakeCurrent** with *ctx* have no effect on its viewport.

To release the current context without assigning a new one, call **glXMakeCurrent** with *drawable* and *ctx* set to **None** and **NULL** respectively.

glXMakeCurrent returns **True** if it is successful, **False** otherwise. If **False** is returned, the previously current rendering context and drawable (if any) remain unchanged.

NOTES

A process is a single-execution environment, implemented in a single address space, consisting of one or more threads.

A thread is one of a set of subprocesses that share a single address space, but maintain separate program counters, stack spaces, and other related global data. A thread that is the only member of its subprocess group is equivalent to a process.

ERRORS

BadMatch is generated if *drawable* was not created with the same X screen and visual as *ctx*. It is also generated if *drawable* is **None** and *ctx* is not **None**.

BadAccess is generated if *ctx* was current to another thread at the time **glXMakeCurrent** was called.

GLX_BAD_DRAWABLE is generated if *drawable* is not a valid GLX drawable.

GLX_BAD_CONTEXT is generated if *ctx* is not a valid GLX context.

GLX_BAD_CONTEXT_STATE is generated if **glXMakeCurrent** is called between a call to **glBegin** and the corresponding call to **glEnd**.

GLX_BAD_CONTEXT_STATE is also generated if the rendering context current to the calling thread has OpenGL renderer state **GL_FEEDBACK** or **GL_SELECT**.

GLX_BAD_CURRENT_WINDOW is generated if there are pending OpenGL commands for the previous context and the current drawable is a window that is no longer valid.

BadAlloc may be generated if the server has delayed allocation of ancillary buffers until **glXMakeCurrent** is called, only to find that it has insufficient resources to complete the allocation.

SEE ALSO

glXCreateContext, **glXCreateGLXPixmap**

---

back to the **OpenGL index page**

---

glXIsDirect

NAME

glXIsDirect -- indicate whether direct rendering is enabled

C SPECIFICATION

```
Bool glXIsDirect(Display *dpy,
                 GLXContext ctx)
```

PARAMETERS

dpy
Specifies the connection to the X server.

ctx
Specifies the GLX context that is being queried.

DESCRIPTION

glXIsDirect returns **True** if *ctx* is a direct rendering context, **False** otherwise. Direct rendering contexts pass rendering commands directly from the calling process's address space to the rendering system, bypassing the X server. Nondirect rendering contexts pass all rendering commands to the X server.

ERRORS

GLX_BAD_CONTEXT is generated if *ctx* is not a valid GLX context.

SEE ALSO

glXCreateContext

---

---

glXQueryVersion

NAME

glXQueryVersion -- return the version numbers of the GLX extension

C SPECIFICATION

```
Bool glXQueryVersion(Display *dpy,
                     int *major,
                     int *minor)
```

PARAMETERS

dpy
: Specifies the connection to the X server.

major
: Returns the major version number of the GLX server extension.

minor
: Returns the minor version number of the GLX server extension.

DESCRIPTION

glXQueryVersion returns the major and minor version numbers of the GLX extension implemented by the server associated with connection *dpy*. Implementations with the same major version number are upward compatible, meaning that the implementation with the higher minor number is a superset of the version with the lower minor number.

major and *minor* do not return values if they are specified as **NULL**.

ERRORS

glXQueryVersion returns **False** if it fails, **True** otherwise. *major* and *minor* are not updated when **False** is returned.

NOTES

If the GLX version is 1.1 or 1.0, then the GL version must be 1.0.

SEE ALSO

glXQueryExtension

---

back to the **OpenGL index page**

---

glXQueryExtension

NAME

glXQueryExtension -- indicate whether the GLX extension is supported

C SPECIFICATION

```
Bool glXQueryExtension(Display *dpy,
                       int *errorBase,
                       int *eventBase)
```

PARAMETERS

dpy
Specifies the connection to the X server.

errorBase
Returns the base error code of the GLX server extension.

eventBase
Returns the base event code of the GLX server extension.

DESCRIPTION

glXQueryExtension returns **True** if the X server of connection *dpy* supports the GLX extension, **False** otherwise. If **True** is returned, then *errorBase* and *eventBase* return the error base and event base of the GLX extension. Otherwise, *errorBase* and *eventBase* are unchanged.

errorBase and *eventBase* do not return values if they are specified as **NULL**.

NOTES

eventBase is included for future extensions. GLX does not currently define any events.

SEE ALSO

glXQueryVersion

glXUseXFont

NAME

glXUseXFont -- create bitmap display lists from an X font

C SPECIFICATION

```
void glXUseXFont(Font font,
                 int first,
                 int count,
                 int listBase)
```

PARAMETERS

font
: Specifies the font from which character glyphs are to be taken.

first
: Specifies the index of the first glyph to be taken.

count
: Specifies the number of glyphs to be taken.

listBase
: Specifies the index of the first display list to be generated.

DESCRIPTION

glXUseXFont generates count display lists, named *listBase* through *listBase* + *count* - 1, each containing a single **glBitmap** command. The parameters of the **glBitmap** command of display list *listBase* + *i* are derived from glyph *first* + *i*. Bitmap parameters *xorig*, *yorig*, *width*, and *height* are computed from font metrics as *descent* - 1, -*lbearing*, *rbearing* - *lbearing*, and *ascent* + *descent*, respectively. *xmove* is taken from the glyph's width metric, and *ymove* is set to zero. Finally, the glyph's image is converted to the appropriate format for **glBitmap**.

Using **glXUseXFont** may be more efficient than accessing the X font and generating the display lists explicitly, both because the display lists are created on the server without requiring a round trip of the glyph data, and because the server may choose to delay the creation of each bitmap until it is accessed.

Empty display lists are created for all glyphs that are requested and are not defined in *font*. **glXUseXFont** is ignored if there is no current GLX context.

ERRORS

BadFont is generated if font is not a valid font.

GLX_BAD_CONTEXT_STATE is generated if the current GLX context is in display-list construction mode.

GLX_BAD_CURRENT_WINDOW is generated if the drawable associated with the current context of the calling thread is a window, and that window is no longer valid.

SEE ALSO

glBitmap, **glXMakeCurrent**

---

glXSwapBuffers

NAME

glXSwapBuffers -- exchange front and back buffers

C SPECIFICATION

```
void glXSwapBuffers(Display *dpy,
                    GLXDrawable drawable)
```

PARAMETERS

dpy
Specifies the connection to the X server.

drawable
Specifies the window whose buffers are to be swapped.

DESCRIPTION

glXSwapBuffers promotes the contents of the back buffer of *drawable* to become the contents of the front buffer of *drawable*. The contents of the back buffer then become undefined. The update typically takes place during the vertical retrace of the monitor, rather than immediately after **glXSwapBuffers** is called. All GLX rendering contexts share the same notion of which are front buffers and which are back buffers.

An implicit **glFlush** is done by **glXSwapBuffers** before it returns. Subsequent OpenGL commands can be issued immediately after calling **glXSwapBuffers**, but are not executed until the buffer exchange is completed.

If *drawable* was not created with respect to a double-buffered visual, **glXSwapBuffers** has no effect, and no error is generated.

NOTES

Synchronization of multiple GLX contexts rendering to the same double-buffered window is the responsibility of the clients. The X Synchronization Extension can be used to facilitate such cooperation.

ERRORS

GLX_BAD_DRAWABLE is generated if *drawable* is not a valid GLX drawable.

GLX_BAD_CURRENT_WINDOW is generated if *dpy* and *drawable* are respectively the display and drawable associated with the current context of the calling thread, and *drawable* identifies a window that is no longer valid.

SEE ALSO

glFlush

---

back to the **OpenGL index page**

---

glXWaitX

NAME

glXWaitX -- complete X execution prior to subsequent OpenGL calls

C SPECIFICATION

```
void glXWaitX(void void)
```

DESCRIPTION

X rendering calls made prior to **glXWaitX** are guaranteed to be executed before OpenGL rendering calls made after **glXWaitX**. Although this same result can be achieved using **XSync**, **glXWaitX** does not require a round trip to the server, and it is therefore more efficient in cases where client and server are on separate machines.

glXWaitX is ignored if there is no current GLX context.

NOTES

glXWaitX may or may not flush the OpenGL stream.

ERRORS

GLX_BAD_CURRENT_WINDOW is generated if the drawable associated with the current context of the calling thread is a window, and that window is no longer valid.

SEE ALSO

glFinish, **glFlush**, **glXWaitGL**, **XSync**

---

back to the **OpenGL index page**

---

glXWaitGL

NAME

glXWaitGL -- complete GL execution prior to subsequent X calls

C SPECIFICATION

```
void glXWaitGL(void void)
```

DESCRIPTION

OpenGL rendering calls made prior to **glXWaitGL** are guaranteed to be executed before X rendering calls made after **glXWaitGL**. Although this same result can be achieved using **glFinish**, **glXWaitGL** does not require a round trip to the server, and it is therefore more efficient in cases where client and server are on separate machines.

glXWaitGL is ignored if there is no current GLX context.

NOTES

glXWaitGL may or may not flush the X stream.

ERRORS

GLX_BAD_CURRENT_WINDOW is generated if the drawable associated with the current context of the calling thread is a window, and that window is no longer valid.

gluBeginPolygon, gluEndPolygon

NAME

gluBeginPolygon, **gluEndPolygon** -- delimit a polygon description

C SPECIFICATION

```
void gluBeginPolygon(GLUtriangulatorObj *tobj)
void gluEndPolygon(GLUtriangulatorObj *tobj)
```

PARAMETERS

tobj
: Specifies the tessellation object (created with **gluNewTess**).

DESCRIPTION

gluBeginPolygon and **gluEndPolygon** delimit the definition of a nonconvex polygon. To define such a polygon, first call **gluBeginPolygon**. Then define the contours of the polygon by calling **gluTessVertex** for each vertex and **gluNextContour** to start each new contour. Finally, call **gluEndPolygon** to signal the end of the definition. See the **gluTessVertex** and **gluNextContour** reference pages for more details.

Once **gluEndPolygon** is called, the polygon is tessellated, and the resulting triangles are described through callbacks. See **gluTessCallback** for descriptions of the callback functions.

EXAMPLE

A quadrilateral with a triangular hole in it can be described like this:

```
        gluBeginPolygon(tobj);
           gluTessVertex(tobj, v1, v1);
           gluTessVertex(tobj, v2, v2);
           gluTessVertex(tobj, v3, v3);
           gluTessVertex(tobj, v4, v4);
        gluNextContour(tobj, GLU_INTERIOR);
           gluTessVertex(tobj, v5, v5);
           gluTessVertex(tobj, v6, v6);
           gluTessVertex(tobj, v7, v7);
        gluEndPolygon(tobj);
```

gluBeginCurve, gluEndCurve

NAME

gluBeginCurve, **gluEndCurve** -- delimit a NURBS curve definition

C SPECIFICATION

```
void gluBeginCurve(GLUnurbsObj *nobj)
void gluEndCurve(GLUnurbsObj *nobj)
```

PARAMETERS

nobj
Specifies the NURBS object (created with **gluNewNurbsRenderer**).

DESCRIPTION

Use **gluBeginCurve** to mark the beginning of a NURBS curve definition. After calling **gluBeginCurve**, make one or more calls to **gluNurbsCurve** to define the attributes of the curve. Exactly one of the calls to **gluNurbsCurve** must have a curve type of **GL_MAP1_VERTEX_3** or **GL_MAP1_VERTEX_4**. To mark the end of the NURBS curve definition, call **gluEndCurve**.

OpenGL evaluators are used to render the NURBS surface as a set of line segments. Evaluator state is preserved during rendering with **glPushAttrib(GL_EVAL_BIT)** and **glPopAttrib()**. See the **glPushAttrib** reference page for details on exactly what state these calls preserve.

EXAMPLE

The following commands render a textured NURBS curve with normals; texture coordinates and normals are also specified as NURBS curves:

```
gluBeginCurve(nobj);
   gluNurbsCurve(nobj, ..., GL_MAP1_TEXTURE_COORD_2);
   gluNurbsCurve(nobj, ..., GL_MAP1_NORMAL);
   gluNurbsCurve(nobj, ..., GL_MAP1_VERTEX_4);
gluEndCurve(nobj);
```

SEE ALSO

glPopAttrib, **glPushAttrib**, **gluBeginSurface**, **gluBeginTrim**, **gluNewNurbsRenderer**, **gluNurbsCurve**

---

back to the < A HREF = "./opengl.html">**OpenGL index page**

---

gluBeginTrim, gluEndTrim

NAME

gluBeginTrim, **gluEndTrim** -- delimit a NURBS trimming loop definition

C SPECIFICATION

```
void gluBeginTrim(GLUnurbsObj *nobj)
void gluEndTrim(GLUnurbsObj *nobj)
```

PARAMETERS

nobj

Specifies the NURBS object (created with **gluNewNurbsRenderer**).

DESCRIPTION

Use **gluBeginTrim** to mark the beginning of a trimming loop, and **gluEndTrim** to mark the end of a trimming loop. A trimming loop is a set of oriented curve segments (forming a closed curve) that define boundaries of a NURBS surface. You include these trimming loops in the definition of a NURBS surface, between calls to **gluBeginSurface** and **gluEndSurface**.

The definition for a NURBS surface can contain many trimming loops. For example, if you wrote a definition for a NURBS surface that resembled a rectangle with a hole punched out, the definition would contain two trimming loops. One loop would define the outer edge of the rectangle; the other would define the hole punched out of the rectangle. The definitions of each of these trimming loops would be bracketed by a **gluBeginTrim** / **gluEndTrim** pair.

The definition of a single closed trimming loop can consist of multiple curve segments, each described as a piecewise linear curve (see **gluPwlCurve**) or as a single NURBS curve (see **gluNurbsCurve**), or as a combination of both in any order. The only library calls that can appear in a trimming loop definition (between the calls to **gluBeginTrim** and **gluEndTrim**) are **gluPwlCurve** and **gluNurbsCurve**.

The area of the NURBS surface that is displayed is the region in the domain to the left of the trimming curve as the curve parameter increases. Thus, the retained region of the NURBS surface is inside a counterclockwise trimming loop and outside a clockwise trimming loop. For the rectangle mentioned earlier, the trimming loop for the outer edge of the rectangle runs counterclockwise, while the trimming loop for the punched-out hole runs clockwise.

If you use more than one curve to define a single trimming loop, the curve segments must form a closed loop (that is, the endpoint of each curve must be the starting point of the next curve, and the endpoint of the final curve must be the starting point of the first curve). If the endpoints of the curve are sufficiently close together but not exactly coincident, they will be coerced to match. If the endpoints are not sufficiently close, an error results (see **gluNurbsCallback**).

If a trimming loop definition contains multiple curves, the direction of the curves must be consistent (that is, the inside must be to the left of all of the curves). Nested trimming loops are legal as long as the curve orientations alternate correctly. Trimming curves cannot be self-intersecting, nor can they intersect one another (or an error results).

If no trimming information is given for a NURBS surface, the entire surface is drawn.

EXAMPLE

This code fragment defines a trimming loop that consists of one piecewise linear curve, and two NURBS curves:

```
gluBeginTrim(nobj);
   gluPwlCurve(..., GLU_MAP1_TRIM_2);
   gluNurbsCurve(..., GLU_MAP1_TRIM_2);
   gluNurbsCurve(..., GLU_MAP1_TRIM_3);
gluEndTrim(nobj);
```

SEE ALSO

gluBeginSurface, **gluNewNurbsRenderer**, **gluNurbsCallback**, **gluNurbsCurve**, **gluPwlCurve**

---

back to the < A HREF = "./opengl.html">**OpenGL index page**

---

gluBeginSurface, gluEndSurface

NAME

gluBeginSurface, **gluEndSurface** -- delimit a NURBS surface definition

C SPECIFICATION

```
void gluBeginSurface(GLUnurbsObj *nobj)
void gluEndSurface(GLUnurbsObj *nobj)
```

PARAMETERS

nobj
Specifies the NURBS object (created with **gluNewNurbsRenderer**).

DESCRIPTION

Use **gluBeginSurface** to mark the beginning of a NURBS surface definition. After calling **gluBeginSurface**, make one or more calls to **gluNurbsSurface** to define the attributes of the surface. Exactly one of these calls to **gluNurbsSurface** must have a surface type of **GL_MAP2_VERTEX_3** or **GL_MAP2_VERTEX_4**. To mark the end of the NURBS surface definition, call **gluEndSurface**.

Trimming of NURBS surfaces is supported with **gluBeginTrim**, **gluPwlCurve**, **gluNurbsCurve**, and **gluEndTrim**. Refer to the **gluBeginTrim** reference page for details.

OpenGL evaluators are used to render the NURBS surface as a set of polygons. Evaluator state is preserved during rendering with **glPushAttrib(GL_EVAL_BIT)** and **glPopAttrib()**. See the **glPushAttrib** reference page for details on exactly what state these calls preserve.

EXAMPLE

The following commands render a textured NURBS surface with normals; the texture coordinates and normals are also described as NURBS surfaces:

```
gluBeginSurface(nobj);
   gluNurbsSurface(nobj, ..., GL_MAP2_TEXTURE_COORD_2);
   gluNurbsSurface(nobj, ..., GL_MAP2_NORMAL);
   gluNurbsSurface(nobj, ..., GL_MAP2_VERTEX_4);
gluEndSurface(nobj);
```

gluBuild2DMipmaps

NAME

gluBuild2DMipmaps -- create 2-D mipmaps

C SPECIFICATION

```
int gluBuild2DMipmaps(GLenum target,
                      GLint components,
                      GLint width,
                      GLint height,
                      GLenum format,
                      GLenum type,
                      const void *data)
```

PARAMETERS

target
: Specifies the target texture. Must be **GL_TEXTURE_2D**.

components
: Specifies the number of color components in the texture. Must be 1, 2, 3, or 4.

width, *height*
: Specifies the width and height, respectively, of the texture image.

format
: Specifies the format of the pixel data. Must be one of: **GL_COLOR_INDEX**, **GL_RED**, **GL_GREEN**, **GL_BLUE**, **GL_ALPHA**, **GL_RGB**, **GL_RGBA**, **GL_LUMINANCE**, and **GL_LUMINANCE_ALPHA**.

type
: Specifies the data type for data. Must be one of: **GL_UNSIGNED_BYTE**, **GL_BYTE**, **GL_BITMAP**, **GL_UNSIGNED_SHORT**, **GL_SHORT**, **GL_UNSIGNED_INT**, **GL_INT**, or **GL_FLOAT**.

data
: Specifies a pointer to the image data in memory.

DESCRIPTION

gluBuild2DMipmaps obtains the input image and generates all mipmap images (using **gluScaleImage**) so that the input image can be used as a mipmapped texture image. **glTexImage2D** is then called to load each of the images. If the dimensions of the input image are not powers of two, then the image is scaled so that both the width and height are powers of two before the mipmaps are generated.

A return value of 0 indicates success. Otherwise, a GLU error code is returned (see **gluErrorString**).

Please refer to the **glTexImage1D** reference page for a description of the acceptable values for the *format* parameter. See the **glDrawPixels** reference page for a description of the acceptable values for the *type* parameter.

---

gluBuild1DMipmaps

NAME

gluBuild1DMipmaps -- create 1-D mipmaps

C SPECIFICATION

```
int gluBuild1DMipmaps(GLenum target,
                      GLint components,
                      GLint width,
                      GLenum format,
                      GLenum type,
                      const void *data)
```

PARAMETERS

target
: Specifies the target texture. Must be **GL_TEXTURE_1D**.

components
: Specifies the number of color components in the texture. Must be 1, 2, 3, or 4.

width
: Specifies the width of the texture image.

format
: Specifies the format of the pixel data. Must be one of **GL_COLOR_INDEX**, **GL_RED**, **GL_GREEN**, **GL_BLUE**, **GL_ALPHA**, **GL_RGB**, **GL_RGBA**, **GL_LUMINANCE**, and **GL_LUMINANCE_ALPHA**.

type
: Specifies the data type for data. Must be one of **GL_UNSIGNED_BYTE**, **GL_BYTE**, **GL_BITMAP**, **GL_UNSIGNED_SHORT**, **GL_SHORT**, **GL_UNSIGNED_INT**, **GL_INT**, or **GL_FLOAT**.

data
: Specifies a pointer to the image data in memory.

DESCRIPTION

gluBuild1DMipmaps obtains the input image and generates all mipmap images (using **gluScaleImage**) so that the input image can be used as a mipmapped texture image. **glTexImage1D** is then called to load each of the images. If the width of the input image is not a power of two, then the image is scaled to the nearest power of two before the mipmaps are generated.

A return value of zero indicates success. Otherwise, a GLU error code is returned (see **gluErrorString**).

Please refer to the **glTexImage1D** reference page for a description of the acceptable values for the *format* parameter. See the **glDrawPixels** reference page for a description of the acceptable values for the *type* parameter.

gluDeleteNurbsRenderer

NAME

gluDeleteNurbsRenderer -- destroy a NURBS object

C SPECIFICATION

```
void gluDeleteNurbsRenderer(GLUnurbsObj *nobj)
```

PARAMETERS

nobj
Specifies the NURBS object to be destroyed (created with **gluNewNurbsRenderer**).

DESCRIPTION

gluDeleteNurbsRenderer destroys the NURBS object and frees any memory used by it. Once **gluDeleteNurbsRenderer** has been called, *nobj* cannot be used again.

SEE ALSO

gluNewNurbsRenderer

---

back to the **OpenGL index page**

---

gluCylinder

NAME

gluCylinder -- draw a cylinder

C SPECIFICATION

```
void gluCylinder(GLUquadricObj *qobj,
                 GLdouble baseRadius,
                 GLdouble topRadius,
                 GLdouble height,
                 GLint slices,
                 GLint stacks)
```

PARAMETERS

qobj
: Specifies the quadrics object (created with **gluNewQuadric**).

baseRadius
: Specifies the radius of the cylinder at $z = 0$.

topRadius
: Specifies the radius of the cylinder at $z = height$.

height
: Specifies the height of the cylinder.

slices
: Specifies the number of subdivisions around the *z* axis.

stacks
: Specifies the number of subdivisions along the *z* axis.

DESCRIPTION

gluCylinder draws a cylinder oriented along the *z* axis. The base of the cylinder is placed at $z = 0$, and the top at $z = height$. Like a sphere, a cylinder is subdivided around the *z* axis into slices, and along the *z* axis into stacks.

Note that if *topRadius* is set to zero, then this routine will generate a cone.

If the orientation is set to **GLU_OUTSIDE** (with **gluQuadricOrientation**), then any generated normals point away from the *z* axis. Otherwise, they point toward the *z* axis.

If texturing is turned on (with **gluQuadricTexture**), then texture coordinates are generated so that *t* ranges linearly from 0.0 at $z = 0$ to 1.0 at $z = height$, and *s* ranges from 0.0 at the +*y* axis, to 0.25 at the +*x* axis, to 0.5 at the -*y* axis, to 0.75 at the -*x* axis, and back to 1.0 at the +*y* axis.

gluBeginCurve, gluEndCurve

NAME

gluBeginCurve, **gluEndCurve** -- delimit a NURBS curve definition

C SPECIFICATION

```
void gluBeginCurve(GLUnurbsObj *nobj)
void gluEndCurve(GLUnurbsObj *nobj)
```

PARAMETERS

nobj

Specifies the NURBS object (created with **gluNewNurbsRenderer**).

DESCRIPTION

Use **gluBeginCurve** to mark the beginning of a NURBS curve definition. After calling **gluBeginCurve**, make one or more calls to **gluNurbsCurve** to define the attributes of the curve. Exactly one of the calls to **gluNurbsCurve** must have a curve type of **GL_MAP1_VERTEX_3** or **GL_MAP1_VERTEX_4**. To mark the end of the NURBS curve definition, call **gluEndCurve**.

OpenGL evaluators are used to render the NURBS surface as a set of line segments. Evaluator state is preserved during rendering with **glPushAttrib(GL_EVAL_BIT)** and **glPopAttrib()**. See the **glPushAttrib** reference page for details on exactly what state these calls preserve.

EXAMPLE

The following commands render a textured NURBS curve with normals; texture coordinates and normals are also specified as NURBS curves:

```
gluBeginCurve(nobj);
   gluNurbsCurve(nobj, ..., GL_MAP1_TEXTURE_COORD_2);
   gluNurbsCurve(nobj, ..., GL_MAP1_NORMAL);
   gluNurbsCurve(nobj, ..., GL_MAP1_VERTEX_4);
gluEndCurve(nobj);
```

SEE ALSO

gluDisk

NAME

gluDisk -- draw a disk

C SPECIFICATION

```
void gluDisk(GLUquadricObj *qobj,
             GLdouble innerRadius,
             GLdouble outerRadius,
             GLint slices,
             GLint loops)
```

PARAMETERS

qobj
: Specifies the quadrics object (created with **gluNewQuadric**).

innerRadius
: Specifies the inner radius of the disk (may be 0).

outerRadius
: Specifies the outer radius of the disk.

slices
: Specifies the number of subdivisions around the *z* axis.

loops
: Specifies the number of concentric rings about the origin into which the disk is subdivided.

DESCRIPTION

gluDisk renders a disk on the $z = 0$ plane. The disk has a radius of *outerRadius*, and contains a concentric circular hole with a radius of *innerRadius*. If *innerRadius* is 0, then no hole is generated. The disk is subdivided around the *z* axis into slices (like pizza slices), and also about the *z* axis into rings (as specified by slices and loops, respectively).

With respect to orientation, the +*z* side of the disk is considered to be "outside" (see **gluQuadricOrientation**). This means that if the orientation is set to **GLU_OUTSIDE**, then any normals generated point along the +*z* axis. Otherwise, they point along the -*z* axis.

If texturing is turned on (with **gluQuadricTexture**), texture coordinates are generated linearly such that where r = *outerRadius*, the value at $(r, 0, 0)$ is (1, 0.5), at $(0, r, 0)$ it is (0.5, 1), at $(-r, 0, 0)$ it is (0, 0.5), and at $(0, -r, 0)$ it is (0.5, 0).

gluBeginSurface, gluEndSurface

NAME

gluBeginSurface, **gluEndSurface** -- delimit a NURBS surface definition

C SPECIFICATION

```
void gluBeginSurface(GLUnurbsObj *nobj)
void gluEndSurface(GLUnurbsObj *nobj)
```

PARAMETERS

nobj
Specifies the NURBS object (created with **gluNewNurbsRenderer**).

DESCRIPTION

Use **gluBeginSurface** to mark the beginning of a NURBS surface definition. After calling **gluBeginSurface**, make one or more calls to **gluNurbsSurface** to define the attributes of the surface. Exactly one of these calls to **gluNurbsSurface** must have a surface type of **GL_MAP2_VERTEX_3** or **GL_MAP2_VERTEX_4**. To mark the end of the NURBS surface definition, call **gluEndSurface**.

Trimming of NURBS surfaces is supported with **gluBeginTrim**, **gluPwlCurve**, **gluNurbsCurve**, and **gluEndTrim**. Refer to the **gluBeginTrim** reference page for details.

OpenGL evaluators are used to render the NURBS surface as a set of polygons. Evaluator state is preserved during rendering with **glPushAttrib(GL_EVAL_BIT)** and **glPopAttrib()**. See the **glPushAttrib** reference page for details on exactly what state these calls preserve.

EXAMPLE

The following commands render a textured NURBS surface with normals; the texture coordinates and normals are also described as NURBS surfaces:

```
gluBeginSurface(nobj);
   gluNurbsSurface(nobj, ..., GL_MAP2_TEXTURE_COORD_2);
   gluNurbsSurface(nobj, ..., GL_MAP2_NORMAL);
   gluNurbsSurface(nobj, ..., GL_MAP2_VERTEX_4);
gluEndSurface(nobj);
```

gluBeginPolygon, gluEndPolygon

NAME

gluBeginPolygon, **gluEndPolygon** -- delimit a polygon description

C SPECIFICATION

```
void gluBeginPolygon(GLUtriangulatorObj *tobj)
void gluEndPolygon(GLUtriangulatorObj *tobj)
```

PARAMETERS

tobj
: Specifies the tessellation object (created with **gluNewTess**).

DESCRIPTION

gluBeginPolygon and **gluEndPolygon** delimit the definition of a nonconvex polygon. To define such a polygon, first call **gluBeginPolygon**. Then define the contours of the polygon by calling **gluTessVertex** for each vertex and **gluNextContour** to start each new contour. Finally, call **gluEndPolygon** to signal the end of the definition. See the **gluTessVertex** and **gluNextContour** reference pages for more details.

Once **gluEndPolygon** is called, the polygon is tessellated, and the resulting triangles are described through callbacks. See **gluTessCallback** for descriptions of the callback functions.

EXAMPLE

A quadrilateral with a triangular hole in it can be described like this:

```
gluBeginPolygon(tobj);
   gluTessVertex(tobj, v1, v1);
   gluTessVertex(tobj, v2, v2);
   gluTessVertex(tobj, v3, v3);
   gluTessVertex(tobj, v4, v4);
gluNextContour(tobj, GLU_INTERIOR);
   gluTessVertex(tobj, v5, v5);
   gluTessVertex(tobj, v6, v6);
   gluTessVertex(tobj, v7, v7);
gluEndPolygon(tobj);
```

SEE ALSO

gluErrorString

NAME

gluErrorString -- produce an error string from an OpenGL or GLU error code

C SPECIFICATION

`const GLubyte* gluErrorString(GLenum errorCode)`

PARAMETERS

errorCode
Specifies an OpenGL or GLU error code.

DESCRIPTION

gluErrorString produces an error string from an OpenGL or GLU error code. The string is in an ISO Latin 1 format. For example, **gluErrorString**(**GL_OUT_OF_MEMORY**) returns the string *out of memory*.

The standard GLU error codes are **GLU_INVALID_ENUM**, **GLU_INVALID_VALUE**, and **GLU_OUT_OF_MEMORY**. Certain other GLU functions can return specialized error codes through callbacks. Refer to the **glGetError** reference page for the list of OpenGL error codes.

gluBeginTrim, gluEndTrim

NAME

gluBeginTrim, **gluEndTrim** -- delimit a NURBS trimming loop definition

C SPECIFICATION

```
void gluBeginTrim(GLUnurbsObj *nobj)
void gluEndTrim(GLUnurbsObj *nobj)
```

PARAMETERS

nobj

Specifies the NURBS object (created with **gluNewNurbsRenderer**).

DESCRIPTION

Use **gluBeginTrim** to mark the beginning of a trimming loop, and **gluEndTrim** to mark the end of a trimming loop. A trimming loop is a set of oriented curve segments (forming a closed curve) that define boundaries of a NURBS surface. You include these trimming loops in the definition of a NURBS surface, between calls to **gluBeginSurface** and **gluEndSurface**.

The definition for a NURBS surface can contain many trimming loops. For example, if you wrote a definition for a NURBS surface that resembled a rectangle with a hole punched out, the definition would contain two trimming loops. One loop would define the outer edge of the rectangle; the other would define the hole punched out of the rectangle. The definitions of each of these trimming loops would be bracketed by a **gluBeginTrim** / **gluEndTrim** pair.

The definition of a single closed trimming loop can consist of multiple curve segments, each described as a piecewise linear curve (see **gluPwlCurve**) or as a single NURBS curve (see **gluNurbsCurve**), or as a combination of both in any order. The only library calls that can appear in a trimming loop definition (between the calls to **gluBeginTrim** and **gluEndTrim**) are **gluPwlCurve** and **gluNurbsCurve**.

The area of the NURBS surface that is displayed is the region in the domain to the left of the trimming curve as the curve parameter increases. Thus, the retained region of the NURBS surface is inside a counterclockwise trimming loop and outside a clockwise trimming loop. For the rectangle mentioned earlier, the trimming loop for the outer edge of the rectangle runs counterclockwise, while the trimming loop for the punched-out hole runs clockwise.

If you use more than one curve to define a single trimming loop, the curve segments must form a closed loop (that is, the endpoint of each curve must be the starting point of the next curve, and the endpoint of the final curve must be the starting point of the first curve). If the endpoints of the curve are sufficiently close together but not exactly coincident, they will be coerced to match. If the endpoints are not sufficiently close, an error results (see **gluNurbsCallback**).

If a trimming loop definition contains multiple curves, the direction of the curves must be consistent (that is, the inside must be to the left of all of the curves). Nested trimming loops are legal as long as the curve orientations alternate correctly. Trimming curves cannot be self-intersecting, nor can they intersect one another (or an error results).

If no trimming information is given for a NURBS surface, the entire surface is drawn.

EXAMPLE

This code fragment defines a trimming loop that consists of one piecewise linear curve, and two NURBS curves:

```
gluBeginTrim(nobj);
   gluPwlCurve(..., GLU_MAP1_TRIM_2);
   gluNurbsCurve(..., GLU_MAP1_TRIM_2);
   gluNurbsCurve(..., GLU_MAP1_TRIM_3);
gluEndTrim(nobj);
```

gluLoadSamplingMatrices

NAME

gluLoadSamplingMatrices -- load NURBS sampling and culling matrices

C SPECIFICATION

```
void gluLoadSamplingMatrices(GLUnurbsObj *nobj,
                             const GLfloat modelMatrix[16],
                             const GLfloat projMatrix[16],
                             const GLint viewport[4])
```

PARAMETERS

nobj
: Specifies the NURBS object (created with **gluNewNurbsRenderer**).

modelMatrix
: Specifies a modelview matrix (as from a **glGetFloatv** call).

projMatrix
: Specifies a projection matrix (as from a **glGetFloatv** call).

viewport
: Specifies a viewport (as from a **glGetIntegerv** call).

DESCRIPTION

gluLoadSamplingMatrices uses *modelMatrix*, *projMatrix*, and *viewport* to recompute the sampling and culling matrices stored in *nobj*. The sampling matrix determines how finely a NURBS curve or surface must be tessellated to satisfy the sampling tolerance (as determined by the **GLU_SAMPLING_TOLERANCE** property). The culling matrix is used in deciding if a NURBS curve or surface should be culled before rendering (when the **GLU_CULLING** property is turned on).

gluLoadSamplingMatrices is necessary only if the **GLU_AUTO_LOAD_MATRIX** property is turned off (see **gluNurbsProperty**). Although it can be convenient to leave the **GLU_AUTO_LOAD_MATRIX** property turned on, there can be a performance penalty for doing so. (A round trip to the OpenGL server is needed to fetch the current values of the modelview matrix, projection matrix, and viewport.)

---

gluGetNurbsProperty

NAME

gluGetNurbsProperty -- get a NURBS property

C SPECIFICATION

```
void gluGetNurbsProperty(GLUnurbsObj *nobj,
                         GLenum property,
                         GLfloat *value)
```

PARAMETERS

nobj
: Specifies the NURBS object (created with **gluNewNurbsRenderer**).

property
: Specifies the property whose value is to be fetched. Valid values are **GLU_CULLING**, **GLU_SAMPLING_TOLERANCE**, **GLU_DISPLAY_MODE**, and **GLU_AUTO_LOAD_MATRIX**.

value
: Specifies a pointer to the location into which the value of the named property is written.

DESCRIPTION

gluGetNurbsProperty is used to retrieve properties stored in a NURBS object. These properties affect the way that NURBS curves and surfaces are rendered. Please refer to the **gluNurbsProperty** reference page for information about what the properties are and what they do.

gluLookAt

NAME

gluLookAt -- define a viewing transformation

C SPECIFICATION

```
void gluLookAt(GLdouble eyex,
               GLdouble eyey,
               GLdouble eyez,
               GLdouble centerx,
               GLdouble centery,
               GLdouble centerz,
               GLdouble upx,
               GLdouble upy,
               GLdouble upz)
```

PARAMETERS

eyex, *eyey*, *eyez*
: Specifies the position of the eye point.

centerx, *centery*, *centerz*
: Specifies the position of the reference point.

upx, *upy*, *upz*
: Specifies the direction of the up vector.

DESCRIPTION

gluLookAt creates a viewing matrix derived from an eye point, a reference point indicating the center of the scene, and an up vector. The matrix maps the reference point to the negative *z* axis and the eye point to the origin, so that, when a typical projection matrix is used, the center of the scene maps to the center of the viewport. Similarly, the direction described by the up vector projected onto the viewing plane is mapped to the positive *y* axis so that it points upward in the viewport. The up vector must not be parallel to the line of sight from the eye to the reference point.

The matrix generated by **gluLookAt** postmultiplies the current matrix.

gluNurbsCallback

NAME

gluNurbsCallback -- define a callback for a NURBS object

C SPECIFICATION

```
void gluNurbsCallback(GLUnurbsObj *nobj,
                      GLenum which,
                      void (*fn)() )
```

PARAMETERS

nobj
: Specifies the NURBS object (created with **gluNewNurbsRenderer**).

which
: Specifies the callback being defined. The only valid value is **GLU_ERROR**.

fn
: Specifies the function that the callback calls.

DESCRIPTION

gluNurbsCallback is used to define a callback to be used by a NURBS object. If the specified callback is already defined, then it is replaced. If *fn* is NULL, then any existing callback is erased.

The one legal callback is **GLU_ERROR**:

GLU_ERROR
: The error function is called when an error is encountered. Its single argument is of type GLenum, and it indicates the specific error that occurred. There are 37 errors unique to NURBS named **GLU_NURBS_ERROR1** through **GLU_NURBS_ERROR37**. Character strings describing these errors can be retrieved with **gluErrorString**.

SEE ALSO

gluErrorString, **gluNewNurbsRenderer**

---

back to the **OpenGL index page**

---

gluNextContour

NAME

gluNextContour -- mark the beginning of another contour

C SPECIFICATION

```
void gluNextContour(GLUtriangulatorObj *tobj,
                    GLenum type)
```

PARAMETERS

tobj
: Specifies the tessellation object (created with **gluNewTess**).

type
: Specifies the type of the contour being defined. Valid values are **GLU_EXTERIOR**, **GLU_INTERIOR**, **GLU_UNKNOWN**, **GLU_CCW**, and **GLU_CW**.

DESCRIPTION

gluNextContour is used in describing polygons with multiple contours. After the first contour has been described through a series of **gluTessVertex** calls, a **gluNextContour** call indicates that the previous contour is complete and that the next contour is about to begin. Another series of **gluTessVertex** calls is then used to describe the new contour. This process can be repeated until all contours have been described.

type defines what type of contour follows. The legal contour types are as follows:

GLU_EXTERIOR
: An exterior contour defines an exterior boundary of the polygon.

GLU_INTERIOR
: An interior contour defines an interior boundary of the polygon (such as a hole).

GLU_UNKNOWN
: An unknown contour is analyzed by the library to determine if it is interior or exterior.

GLU_CCW, **GLU_CW**
: The first **GLU_CCW** or **GLU_CW** contour defined is considered to be exterior. All other contours are considered to be exterior if they are oriented in the same direction (clockwise or counterclockwise) as the first contour, and interior if they are not.

: If one contour is of type **GLU_CCW** or **GLU_CW**, then all contours must be of the same type (if they are not, then all **GLU_CCW** and **GLU_CW** contours will be changed to **GLU_UNKNOWN**).

: Note that there is no real difference between the **GLU_CCW** and **GLU_CW** contour types.

gluNextContour can be called before the first contour is described to define the type of the first contour. If **gluNextContour** is not called before the first contour, then the first contour is marked **GLU_EXTERIOR**.

EXAMPLE

A quadrilateral with a triangular hole in it can be described as follows:

```
gluBeginPolygon(tobj);
   gluTessVertex(tobj, v1, v1);
   gluTessVertex(tobj, v2, v2);
   gluTessVertex(tobj, v3, v3);
   gluTessVertex(tobj, v4, v4);
gluNextContour(tobj, GLU_INTERIOR);
   gluTessVertex(tobj, v5, v5);
   gluTessVertex(tobj, v6, v6);
   gluTessVertex(tobj, v7, v7);
gluEndPolygon(tobj);
```

gluNurbsProperty

NAME

gluNurbsProperty -- set a NURBS property

C SPECIFICATION

```
void gluNurbsProperty(GLUnurbsObj *nobj,
                      GLenum property,
                      GLfloat value)
```

PARAMETERS

nobj
: Specifies the NURBS object (created with **gluNewNurbsRenderer**).

property
: Specifies the property to be set. Valid values are **GLU_AUTO_LOAD_MATRIX**, **GLU_CULLING**, **GLU_DISPLAY_MODE**, and **GLU_SAMPLING_TOLERANCE**.

value
: Specifies the value to which to set the indicated property.

DESCRIPTION

gluNurbsProperty is used to control properties stored in a NURBS object. These properties affect the way that a NURBS curve is rendered. The legal values for *property* are as follows:

GLU_AUTO_LOAD_MATRIX
: *value* is a Boolean value. When set to **GL_TRUE**, the NURBS code downloads the projection matrix, the modelview matrix, and the viewport from the OpenGL server to compute sampling and culling matrices for each NURBS curve that is rendered. Sampling and culling matrices are required to determine the tesselation of a NURBS surface into line segments or polygons and to cull a NURBS surface if it lies outside of the viewport. If this mode is set to **GL_FALSE**, then the user needs to provide a projection matrix, a modelview matrix, and a viewport for the NURBS renderer to use to construct sampling and culling matrices. This can be done with the **gluLoadSamplingMatrices** function. The default for this mode is **GL_TRUE**. Changing this mode from **GL_TRUE** to **GL_FALSE** does not affect the sampling and culling matrices until **gluLoadSamplingMatrices** is called.

GLU_CULLING
: *value* is a Boolean value that, when set to **GL_TRUE**, indicates that a NURBS curve should be discarded prior to tessellation if its control points lie outside the current viewport. The default is **GL_FALSE** (because a NURBS curve cannot fall entirely within the convex hull of its control points).

GLU_DISPLAY_MODE
: *value* defines how a NURBS surface should be rendered. *value* can be set to **GLU_FILL**, **GLU_OUTLINE_POLYGON**, or **GLU_OUTLINE_PATCH**. When set to **GLU_FILL**, the surface is rendered as a set of polygons. **GLU_OUTLINE_POLYGON** instructs the NURBS library to draw only the outlines of the polygons created by tessellation. **GLU_OUTLINE_PATCH** causes just the outlines of patches and trim curves defined by the user to be drawn. The default value is **GLU_FILL**.

GLU_SAMPLING_TOLERANCE

Specifies the maximum length, in pixels to use when the sampling method is set to **GLU_PATH_LENGTH**. The NURBS code is conservative when rendering a curve or surface, so the actual length can be somewhat shorter. The default value is 50.0 pixels.

gluNurbsCurve

NAME

gluNurbsCurve -- define the shape of a NURBS curve

C SPECIFICATION

```
void gluNurbsCurve(GLUnurbsObj *nobj,
                   GLint nknots,
                   GLfloat *knot,
                   GLint stride,
                   GLfloat *ctlarray,
                   GLint order,
                   GLenum type)
```

PARAMETERS

nobj
: Specifies the NURBS object (created with **gluNewNurbsRenderer**).

nknots
: Specifies the number of knots in *knot*. *nknots* equals the number of control points plus the order.

knot
: Specifies an array of *nknots* nondecreasing knot values.

stride
: Specifies the offset (as a number of single-precision floating-point values) between successive curve control points.

ctlarray
: Specifies a pointer to an array of control points. The coordinates must agree with *type*, specified below.

order
: Specifies the order of the NURBS curve. *order* equals degree + 1, hence a cubic curve has an order of 4.

type
: Specifies the type of the curve. If this curve is defined within a **gluBeginCurve** / **gluEndCurve** pair, then the type can be any of the valid one-dimensional evaluator types (such as **GL_MAP1_VERTEX_3** or **GL_MAP1_COLOR_4**). Between a **gluBeginTrim** / **gluEndTrim** pair, the only valid types are **GLU_MAP1_TRIM_2** and **GLU_MAP1_TRIM_3**.

DESCRIPTION

Use **gluNurbsCurve** to describe a NURBS curve.

When **gluNurbsCurve** appears between a **gluBeginCurve** / **gluEndCurve** pair, it is used to describe a curve to be rendered. Positional, texture, and color coordinates are associated by presenting each as a separate **gluNurbsCurve** between a **gluBeginCurve** / **gluEndCurve** pair. No more than one call to **gluNurbsCurve** for each of color, position, and texture data can be made within a single **gluBeginCurve** / **gluEndCurve** pair. Exactly one call must be made to describe the position of the curve (a type of **GL_MAP1_VERTEX_3** or **GL_MAP1_VERTEX_4)**.

When **gluNurbsCurve** appears between a **gluBeginCurve** / **gluEndCurve** pair, it is used to describe a trimming curve on a NURBS surface. If type is **GLU_MAP1_TRIM_2**, then it describes a curve in two-dimensional (*u* and *v*) parameter space. If it is **GLU_MAP1_TRIM_3**, then it describes a curve in two-dimensional homogeneous (*u*, *v*, and *w*) parameter space. See the **gluBeginTrim** reference page for more discussion about trimming curves.

EXAMPLE

The following commands render a textured NURBS curve with normals:

```
gluBeginCurve(nobj);
   gluNurbsCurve(nobj, ..., GL_MAP1_TEXTURE_COORD_2);
   gluNurbsCurve(nobj, ..., GL_MAP1_NORMAL);
   gluNurbsCurve(nobj, ..., GL_MAP1_VERTEX_4);
gluEndCurve(nobj);
```

NOTES

To define trim curves which stitch well use **gluPwlCurve**.

---

gluOrtho2D

NAME

gluOrtho2D -- define a 2-D orthographic projection matrix

C SPECIFICATION

```
void gluOrtho2D(GLdouble left,
                GLdouble right,
                GLdouble bottom,
                GLdouble top)
```

PARAMETERS

left, *right*
: Specify the coordinates for the left and right vertical clipping planes.

bottom, *top*
: Specify the coordinates for the bottom and top horizontal clipping planes.

DESCRIPTION

gluOrtho2D sets up a two-dimensional orthographic viewing region. This is equivalent to calling **glOrtho** with *near* = 0 and *far* = 1.

SEE ALSO

glOrtho, **gluPerspective**

---

back to the **OpenGL index page**

---

gluNurbsSurface

NAME

gluNurbsSurface -- define the shape of a NURBS surface

C SPECIFICATION

```
void gluNurbsSurface(GLUnurbsObj *nobj,
                     GLint sknot_count,
                     GLfloat *sknot,
                     GLint tknot_count,
                     GLfloat *tknot,
                     GLint s_stride,
                     GLint t_stride,
                     GLfloat *ctlarray,
                     GLint sorder,
                     GLint torder,
                     GLenum type)
```

PARAMETERS

nobj
: Specifies the NURBS object (created with **gluNewNurbsRenderer**).

sknot_count
: Specifies the number of knots in the parametric *s* direction.

sknot
: Specifies an array of *sknot_count* nondecreasing knot values in the parametric *s* direction.

tknot_count
: Specifies the number of knots in the parametric *t* direction.

tknot
: Specifies an array of *tknot_count* nondecreasing knot values in the parametric *t* direction.

s_stride
: Specifies the offset (as a number of single-precision floating point values) between successive control points in the parametric *s* direction in *ctlarray*.

t_stride
: Specifies the offset (in single-precision floating-point values) between successive control points in the parametric *t* direction in *ctlarray*.

ctlarray
: Specifies an array containing control points for the NURBS surface. The offsets between successive control points in the parametric *s* and *t* directions are given by *s_stride* and *t_stride*.

sorder
: Specifies the order of the NURBS surface in the parametric *s* direction. The order is one more than the degree, hence a surface that is cubic in *s* has a *sorder* of 4.

torder
: Specifies the order of the NURBS surface in the parametric *t* direction. The order is one more than the degree, hence a surface that is cubic in *t* has a *torder* of 4.

type

Specifies type of the surface. *type* can be any of the valid two-dimensional evaluator types (such as **GL_MAP2_VERTEX_3** or **GL_MAP2_COLOR_4**).

DESCRIPTION

Use **gluNurbsSurface** within a NURBS (Non-Uniform Rational B-Spline) surface definition to describe the shape of a NURBS surface (before any trimming). To mark the beginning of a NURBS surface definition, use the **gluBeginSurface** command. To mark the end of a NURBS surface definition, use the **gluEndSurface** command. Call **gluNurbsSurface** within a NURBS surface definition only.

Positional, texture, and color coordinates are associated with a surface by presenting each as a separate gluNurbsSurface between a **gluBeginSurface** / **gluEndSurface** pair. No more than one call to **gluNurbsSurface** for each of color, position, and texture data can be made within a single **gluBeginSurface** / **gluEndSurface** pair. Exactly one call must be made to describe the position of the surface (a type of **GL_MAP2_VERTEX_3** or **GL_MAP2_VERTEX_4**).

A NURBS surface can be trimmed by using the commands **gluNurbsCurve** and **gluPwlCurve** between calls to **gluBeginTrim** and **gluEndTrim**.

Note that a **gluNurbsSurface** with *sknot_count* knots in the *s* direction and *tknot_count* knots in the *t* direction with orders *sorder* and *torder* must have (*sknot_count* - *sorder*) * (*tknot_count* - *torder*) control points.

EXAMPLE

The following commands render a textured NURBS surface with normals; the texture coordinates and normals are also NURBS surfaces:

```
gluBeginSurface(nobj);
   gluNurbsSurface(nobj, ..., GL_MAP2_TEXTURE_COORD_2);
   gluNurbsSurface(nobj, ..., GL_MAP2_NORMAL);
   gluNurbsSurface(nobj, ..., GL_MAP2_VERTEX_4);
gluEndSurface(nobj);
```

SEE ALSO

gluBeginSurface, **gluBeginTrim**, **gluNewNurbsRenderer**, **gluNurbsCurve**, **gluPwlCurve**

---

---

gluPerspective

NAME

gluPerspective -- set up a perspective projection matrix

C SPECIFICATION

```
void gluPerspective(GLdouble fovy,
                    GLdouble aspect,
                    GLdouble zNear,
                    GLdouble zFar)
```

PARAMETERS

fovy
: Specifies the field of view angle, in degrees, in the *y* direction.

aspect
: Specifies the aspect ratio that determines the field of view in the *x* direction. The aspect ratio is the ratio of *x* (width) to *y* (height).

zNear
: Specifies the distance from the viewer to the near clipping plane (always positive).

zFar
: Specifies the distance from the viewer to the far clipping plane (always positive).

DESCRIPTION

gluPerspective specifies a viewing frustum into the world coordinate system. In general, the aspect ratio in **gluPerspective** should match the aspect ratio of the associated viewport. For example, *aspect* = 2.0 means the viewer's angle of view is twice as wide in *x* as it is in *y*. If the viewport is twice as wide as it is tall, it displays the image without distortion.

The matrix generated by **gluPerspective** is multipled by the current matrix, just as if **glMultMatrix** were called with the generated matrix. To load the perspective matrix onto the current matrix stack instead, precede the call to **gluPerspective** with a call to **glLoadIdentity**.

SEE ALSO

glFrustum, **glLoadIdentity**, **glMultMatrix**, **gluOrtho2D**

---

---

gluPartialDisk

NAME

gluPartialDisk -- draw an arc of a disk

C SPECIFICATION

```
void gluPartialDisk(GLUquadricObj *qobj,
                    GLdouble innerRadius,
                    GLdouble outerRadius,
                    GLint slices,
                    GLint loops,
                    GLdouble startAngle,
                    GLdouble sweepAngle)
```

PARAMETERS

qobj
: Specifies a quadrics object (created with **gluNewQuadric**).

innerRadius
: Specifies the inner radius of the partial disk (can be zero).

outerRadius
: Specifies the outer radius of the partial disk.

slices
: Specfies the number of subdivisions around the *z* axis.

loops
: Specifies the number of concentric rings about the origin into which the partial disk is subdivided.

startAngle
: Specifies the starting angle, in degrees, of the disk portion.

sweepAngle
: Specifies the sweep angle, in degrees, of the disk portion.

DESCRIPTION

gluPartialDisk renders a partial disk on the $z = 0$ plane. A partial disk is similar to a full disk, except that only the subset of the disk from *startAngle* through *startAngle* + *sweepAngle* is included (where 0 degrees is along the +*y* axis, 90 degrees along the +*x* axis, 180 along the -*y* axis, and 270 along the -*x* axis).

The partial disk has a radius of *outerRadius*, and contains a concentric circular hole with a radius of *innerRadius*. If *innerRadius* is zero, then no hole is generated. The partial disk is subdivided around the *z* axis into slices (like pizza slices), and also about the *z* axis into rings (as specified by *slices* and *loops*, respectively).

With respect to orientation, the +*z* side of the partial disk is considered to be outside (see **gluQuadricOrientation**). This means that if the orientation is set to **GLU_OUTSIDE**, then any normals generated point along the +*z* axis. Otherwise, they point along the -*z* axis.

If texturing is turned on (with **gluQuadricTexture**), texture coordinates are generated linearly such that where *r* =

outerRadius, the value at (r, 0, 0) is (1, 0.5), at (0, r, 0) it is (0.5, 1), at ($-r$, 0, 0) it is (0, 0.5), and at (0, $-r$, 0) it is (0.5, 0).

gluProject

NAME

gluProject -- map object coordinates to window coordinates

C SPECIFICATION

```
int gluProject(GLdouble objx,
               GLdouble objy,
               GLdouble objz,
               const GLdouble modelMatrix[16],
               const GLdouble projMatrix[16],
               const GLint viewport[4],
               GLdouble *winx,
               GLdouble *winy,
               GLdouble *winz)
```

PARAMETERS

objx, *objy*, *objz*
: Specify the object coordinates.

modelMatrix
: Specifies the current modelview matrix (as from a **glGetDoublev** call).

projMatrix
: Specifies the current projection matrix (as from a **glGetDoublev** call).

viewport
: Specifies the current viewport (as from a **glGetIntegerv** call).

winx, *winy*, *winz*
: Return the computed window coordinates.

DESCRIPTION

gluProject transforms the specified object coordinates into window coordinates using *modelMatrix*, *projMatrix*, and *viewport*. The result is stored in *winx*, *winy*, and *winz*. A return value of **GL_TRUE** indicates success, and **GL_FALSE** indicates failure.

SEE ALSO

glGet, **gluUnProject**

---

back to the **OpenGL index page**

gluPickMatrix

NAME

gluPickMatrix -- define a picking region

C SPECIFICATION

```
void gluPickMatrix(GLdouble x,
                   GLdouble y,
                   GLdouble width,
                   GLdouble height,
                   GLint viewport[4])
```

PARAMETERS

x, *y*
: Specify the center of a picking region in window coordinates.

width, *height*
: Specify the width and height, respectively, of the picking region in window coordinates.

viewport
: Specifies the current viewport (as from a **glGetIntegerv** call).

DESCRIPTION

gluPickMatrix creates a projection matrix that can be used to restrict drawing to a small region of the viewport. This is typically useful to determine what objects are being drawn near the cursor. Use **gluPickMatrix** to restrict drawing to a small region around the cursor. Then, enter selection mode (with **glRenderMode** and rerender the scene. All primitives that would have been drawn near the cursor are identified and stored in the selection buffer.

The matrix created by **gluPickMatrix** is multiplied by the current matrix just as if **glMultMatrix** is called with the generated matrix. To effectively use the generated pick matrix for picking, first call **glLoadIdentity** to load an identity matrix onto the perspective matrix stack. Then call **gluPickMatrix**, and finally, call a command (such as **gluPerspective**) to multiply the perspective matrix by the pick matrix.

When using **gluPickMatrix** to pick NURBS, be careful to turn off the NURBS property **GLU_AUTO_LOAD_MATRIX**. If **GLU_AUTO_LOAD_MATRIX** is not turned off, then any NURBS surface rendered is subdivided differently with the pick matrix than the way it was subdivided without the pick matrix.

EXAMPLE

When rendering a scene as follows:

```
glMatrixMode(GL_PROJECTION);
glLoadIdentity();
gluPerspective(...);
glMatrixMode(GL_MODELVIEW);
/* Draw the scene */
```

a portion of the viewport can be selected as a pick region like this:

```
glMatrixMode(GL_PROJECTION);
glLoadIdentity();
gluPickMatrix(x, y, width, height, viewport);
```

```
        gluPerspective(...);
        glMatrixMode(GL_MODELVIEW);
        /* Draw the scene */
```

---

gluQuadricCallback

NAME

gluQuadricCallback -- define a callback for a quadrics object

C SPECIFICATION

```
void gluQuadricCallback(GLUquadricObj *qobj,
                        GLenum which,
                        void (*fn)() )
```

PARAMETERS

qobj
: Specifies the quadrics object (created with **gluNewQuadric**)

which
: Specifies the callback being defined. The only valid value is **GLU_ERROR**.

fn
: Specifies the function to be called.

DESCRIPTION

gluQuadricCallback is used to define a new callback to be used by a quadrics object. If the specified callback is already defined, then it is replaced. If *fn* is NULL, then any existing callback is erased.

The one legal callback is **GLU_ERROR**:

GLU_ERROR
: The function is called when an error is encountered. Its single argument is of type GLenum, and it indicates the specific error that occurred. Character strings describing these errors can be retrieved with the **gluErrorString** call.

SEE ALSO

gluErrorString, **gluNewQuadric**

---

back to the **OpenGL index page**

---

gluPwlCurve

NAME

gluPwlCurve -- describe a piecewise linear NURBS trimming curve

C SPECIFICATION

```
void gluPwlCurve(GLUnurbsObj *nobj,
                 GLint count,
                 GLfloat *array,
                 GLint stride,
                 GLenum type)
```

PARAMETERS

nobj
: Specifies the NURBS object (created with **gluNewNurbsRenderer**).

count
: Specifies the number of points on the curve.

array
: Specifies an array containing the curve points.

stride
: Specifies the offset (a number of single-precision floating-point values) between points on the curve.

type
: Specifies the type of curve. Must be either **GLU_MAP1_TRIM_2** or **GLU_MAP1_TRIM_3**.

DESCRIPTION

gluPwlCurve describes a piecewise linear trimming curve for a NURBS surface. A piecewise linear curve consists of a list of coordinates of points in the parameter space for the NURBS surface to be trimmed. These points are connected with line segments to form a curve. If the curve is an approximation to a curve which is not piecewise linear, the points should be close enough in parameter space that the resulting path appears curved at the resolution used in the application.

If type is **GLU_MAP1_TRIM_2**, then it describes a curve in two-dimensional (*u* and *v*) parameter space. If it is **GLU_MAP1_TRIM_3**, then it describes a curve in two-dimensional homogeneous (*u*, *v*, and *w*) parameter space. Please refer to the **gluBeginTrim** reference page for more information about trimming curves.

NOTES

To describe a trim curve which closely follows the contours of a NURBS surface use **gluNurbsCurve**.

SEE ALSO

gluBeginCurve, **gluBeginTrim**, **gluNewNurbsRenderer**, **gluNurbsCurve**

---

back to the **OpenGL index page**

gluQuadricNormals

NAME

gluQuadricNormals -- specify what kind of normals are desired for quadrics

C SPECIFICATION

```
void gluQuadricNormals(GLUquadricObj *quadObject,
                       GLenum normals)
```

PARAMETERS

quadObject
Specifes the quadrics object (created with **gluNewQuadric**).

normals
Specifies the desired type of normals. Valid values are **GLU_NONE**, **GLU_FLAT**, and **GLU_SMOOTH**.

DESCRIPTION

gluQuadricNormals specifies what kind of normals are desired for quadrics rendered with *quadObject*. The legal values are as follows:

GLU_NONE
No normals are generated.

GLU_FLAT
One normal is generated for every facet of a quadric.

GLU_SMOOTH
One normal is generated for every vertex of a quadric. This is the default.

SEE ALSO

gluNewQuadric, **gluQuadricDrawStyle**, **gluQuadricOrientation**, **gluQuadricTexture**

---

back to the **OpenGL index page**

---

gluQuadricDrawStyle

NAME

gluQuadricDrawStyle -- specify the draw style desired for quadrics

C SPECIFICATION

```
void gluQuadricDrawStyle(GLUquadricObj *quadObject,
                          GLenum drawStyle)
```

PARAMETERS

quadObject
: Specifies the quadrics object (created with **gluNewQuadric**).

drawStyle
: Specifies the desired draw style. Valid values are **GLU_FILL**, **GLU_LINE**, **GLU_SILHOUETTE**, and **GLU_POINT**.

DESCRIPTION

gluQuadricDrawStyle specifies the draw style for quadrics rendered with *quadObject*. The legal values are as follows:

GLU_FILL
: Quadrics are rendered with polygon primitives. The polygons are drawn in a counterclockwise fashion with respect to their normals (as defined with **gluQuadricOrientation**).

GLU_LINE
: Quadrics are rendered as a set of lines.

GLU_SILHOUETTE
: Quadrics are rendered as a set of lines, except that edges separating coplanar faces will not be drawn.

GLU_POINT
: Quadrics are rendered as a set of points.

SEE ALSO

gluNewQuadric, **gluQuadricNormals**, **gluQuadricOrientation**, **gluQuadricTexture**

---

back to the **OpenGL index page**

---

gluQuadricTexture

NAME

gluQuadricTexture -- specify if texturing is desired for quadrics

C SPECIFICATION

```
void gluQuadricTexture(GLUquadricObj *quadObject,
                        GLboolean textureCoords)
```

PARAMETERS

quadObject
Specifies the quadrics object (created with **gluNewQuadric**).

textureCoords
Specifies a flag indicating if texture coordinates should be generated.

DESCRIPTION

gluQuadricTexture specifies if texture coordinates should be generated for quadrics rendered with *quadObject*. If the value of *textureCoords* is **GL_TRUE**, then texture coordinates are generated, and if textureCoords is **GL_FALSE**, they are not. The default is **GL_FALSE**.

The manner in which texture coordinates are generated depends upon the specific quadric rendered.

SEE ALSO

gluNewQuadric, **gluQuadricDrawStyle**, **gluQuadricNormals**, **gluQuadricOrientation**

---

back to the **OpenGL index page**

---

gluQuadricOrientation

NAME

gluQuadricOrientation -- specify inside/outside orientation for quadrics

C SPECIFICATION

```
void gluQuadricOrientation(GLUquadricObj *quadObject,
                            GLenum orientation)
```

PARAMETERS

quadObject
: Specifies the quadrics object (created with **gluNewQuadric**).

orientation
: Specifies the desired orientation. Valid values are **GLU_OUTSIDE** and **GLU_INSIDE**.

DESCRIPTION

gluQuadricOrientation specifies what kind of orientation is desired for quadrics rendered with *quadObject*. The orientation values are as follows:

GLU_OUTSIDE
: Quadrics are drawn with normals pointing outward.

GLU_INSIDE
: Normals point inward. The default is **GLU_OUTSIDE**.

Note that the interpretation of outward and inward depends on the quadric being drawn.

SEE ALSO

gluSphere

NAME

gluSphere -- draw a sphere

C SPECIFICATION

```
void gluSphere(GLUquadricObj *qobj,
               GLdouble radius,
               GLint slices,
               GLint stacks)
```

PARAMETERS

qobj
: Specifies the quadrics object (created with **gluNewQuadric**).

radius
: Specifies the radius of the sphere.

slices
: Specifies the number of subdivisions around the *z* axis (similar to lines of longitude).

stacks
: Specifies the number of subdivisions along the *z* axis (similar to lines of latitude).

DESCRIPTION

gluSphere draws a sphere of the given radius centered around the origin. The sphere is subdivided around the *z* axis into slices and along the *z* axis into stacks (similar to lines of longitude and latitude).

If the orientation is set to **GLU_OUTSIDE** (with **gluQuadricOrientation**), then any normals generated point away from the center of the sphere. Otherwise, they point toward the center of the sphere.

If texturing is turned on (with **gluQuadricTexture**), then texture coordinates are generated so that *t* ranges from 0.0 at *z* = -*radius* to 1.0 at *z* = radius (*t* increases linearly along longitudinal lines), and *s* ranges from 0.0 at the +*y* axis, to 0.25 at the +*x* axis, to 0.5 at the -*y* axis, to 0.75 at the -*x* axis, and back to 1.0 at the +*y* axis.

gluScaleImage

NAME

gluScaleImage -- scale an image to an arbitrary size

C SPECIFICATION

```
int gluScaleImage(GLenum format,
                  GLint widthin,
                  GLint heightin,
                  GLenum typein,
                  const void *datain,
                  GLint widthout,
                  GLint heightout,
                  GLenum typeout,
                  void *dataout)
```

PARAMETERS

format
: Specifies the format of the pixel data. The following symbolic values are valid: **GL_COLOR_INDEX**, **GL_STENCIL_INDEX**, **GL_DEPTH_COMPONENT**, **GL_RED**, **GL_GREEN**, **GL_BLUE**, **GL_ALPHA**, **GL_RGB**, **GL_RGBA**, **GL_LUMINANCE**, and **GL_LUMINANCE_ALPHA**.

widthin, *heightin*
: Specify the width and height, respectively, of the source image that is scaled.

typein
: Specifies the data type for datain. Must be one of **GL_UNSIGNED_BYTE**, **GL_BYTE**, **GL_BITMAP**, **GL_UNSIGNED_SHORT**, **GL_SHORT**, **GL_UNSIGNED_INT**, **GL_INT**, or **GL_FLOAT**.

datain
: Specifies a pointer to the source image.

widthout, *heightout*
: Specify the width and height, respectively, of the destination image.

typeout
: Specifies the data type for dataout. Must be one of **GL_UNSIGNED_BYTE**, **GL_BYTE**, **GL_BITMAP**, **GL_UNSIGNED_SHORT**, **GL_SHORT**, **GL_UNSIGNED_INT**, **GL_INT**, or **GL_FLOAT**.

dataout
: Specifies a pointer to the destination image.

DESCRIPTION

gluScaleImage scales a pixel image using the appropriate pixel store modes to unpack data from the source image and pack data into the destination image.

When shrinking an image, **gluScaleImage** uses a box filter to sample the source image and create pixels for the destination image. When magnifying an image, the pixels from the source image are linearly interpolated to create the destination image.

A return value of zero indicates success, otherwise a GLU error code is returned indicating what the problem was (see

gluErrorString).

Please refer to the **glReadPixels** reference page for a description of the acceptable values for the *format*, *typein*, and *typeout* parameters.

gluTessVertex

NAME

gluTessVertex -- specify a vertex on a polygon

C SPECIFICATION

```
void gluTessVertex(GLUtriangulatorObj *tobj,
                   GLdouble v[3],
                   void *data)
```

PARAMETERS

tobj
: Specifies the tessellation object (created with **gluNewTess**).

v
: Specifies the location of the vertex.

data
: Specifies an opaque pointer passed back to the user with the vertex callback (as specified by **gluTessCallback**).

DESCRIPTION

gluTessVertex describes a vertex on a polygon that the user is defining. Successive **gluTessVertex** calls describe a closed contour. For example, if the user wants to describe a quadrilateral, then **gluTessVertex** should be called four times. **gluTessVertex** can only be called between **gluBeginPolygon** and **gluEndPolygon**.

data normally points to a structure containing the vertex location, as well as other per-vertex attributes such as color and normal. This pointer is passed back to the user through the **GLU_VERTEX** callback after tessellation (see **gluTessCallback**).

EXAMPLE

A quadrilateral with a triangular hole in it can be described as follows:

```
        gluBeginPolygon(tobj);
           gluTessVertex(tobj, v1, v1);
           gluTessVertex(tobj, v2, v2);
           gluTessVertex(tobj, v3, v3);
           gluTessVertex(tobj, v4, v4);
        gluNextContour(tobj, GLU_INTERIOR);
           gluTessVertex(tobj, v5, v5);
           gluTessVertex(tobj, v6, v6);
           gluTessVertex(tobj, v7, v7);
        gluEndPolygon(tobj);

gluTessCallback

NAME

gluTessCallback -- define a callback for a tessellation object

C SPECIFICATION

```
void gluTessCallback(GLUtriangulatorObj *tobj,
                     GLenum which,
                     void (*fn)() )
```

PARAMETERS

tobj
: Specifies the tessellation object (created with **gluNewTess**).

which
: Specifies the callback being defined. The following values are valid: **GLU_BEGIN**, **GLU_EDGE_FLAG**, **GLU_VERTEX**, **GLU_END**, and **GLU_ERROR**.

fn
: Specifies the function to be called.

DESCRIPTION

gluTessCallback is used to indicate a callback to be used by a tessellation object. If the specified callback is already defined, then it is replaced. If *fn* is NULL, then the existing callback is erased.

These callbacks are used by the tessellation object to describe how a polygon specified by the user is broken into triangles.

The legal callbacks are as follows:

GLU_BEGIN
: The begin callback is invoked like **glBegin** to indicate the start of a (triangle) primitive. The function takes a single argument of type GLenum that is either **GL_TRIANGLE_FAN**, **GL_TRIANGLE_STRIP**, or **GL_TRIANGLES**.

GLU_EDGE_FLAG
: The edge flag callback is similar to **glEdgeFlag**. The function takes a single Boolean flag that indicates which edges of the created triangles were part of the original polygon defined by the user, and which were created by the tessellation process. If the flag is **GL_TRUE**, then each vertex that follows begins an edge that was part of the original polygon. If the flag is **GL_FALSE**, then each vertex that follows begins an edge that was generated by the tessellator. The edge flag callback (if defined) is invoked before the first vertex callback is made.

  Since triangle fans and triangle strips do not support edge flags, the begin callback is not called with **GL_TRIANGLE_FAN** or **GL_TRIANGLE_STRIP** if an edge flag callback is provided. Instead, the fans and strips are converted to independent triangles.

GLU_VERTEX
: The vertex callback is invoked between the begin and end callbacks. It is similar to **glVertex**, and it defines the vertices of the triangles created by the tessellation process. The function takes a pointer as its only argument.

This pointer is identical to the opaque pointer provided by the user when the vertex was described (see **gluTessVertex**).

GLU_END

The end callback serves the same purpose as **glEnd**. It indicates the end of a primitive and it takes no arguments.

GLU_ERROR

The error callback is called when an error is encountered. The one argument is of type GLenum, and it indicates the specific error that occurred. There are eight errors unique to polygon tessellation, named **GLU_TESS_ERROR1** through **GLU_TESS_ERROR8**. Character strings describing these errors can be retrieved with the **gluErrorString** call.

EXAMPLE

Polygons tessellated can be rendered directly like this:

```
gluTessCallback(tobj, GLU_BEGIN, glBegin);
gluTessCallback(tobj, GLU_VERTEX, glVertex3dv);
gluTessCallback(tobj, GLU_END, glEnd);
gluBeginPolygon(tobj);
   gluTessVertex(tobj, v, v);
   ...
gluEndPolygon(tobj);
```

Typically, the tessellated polygon should be stored in a display list so that it does not need to be retessellated every time it is rendered.

gluUnProject

NAME

gluUnProject -- map window coordinates to object coordinates

C SPECIFICATION

```
int gluUnProject(GLdouble winx,
                 GLdouble winy,
                 GLdouble winz,
                 const GLdouble modelMatrix[16],
                 const GLdouble projMatrix[16],
                 const GLint viewport[4],
                 GLdouble *objx,
                 GLdouble *objy,
                 GLdouble *objz)
```

PARAMETERS

winx, *winy*, *winz*
: Specify the window coordinates to be mapped.

modelMatrix
: Specifies the modelview matrix (as from a **glGetDoublev** call)

projMatrix
: Specifies the projection matrix (as from a **glGetDoublev** call)

viewport
: Specifies the viewport (as from a **glGetIntegerv** call)

objx, *objy*, *objz*
: Returns the computed object coordinates.

DESCRIPTION

gluUnProject maps the specified window coordinates into object coordinates using *modelMatrix*, *projMatrix*, and *viewport*. The result is stored in *objx*, *objy*, and *objz*. A return value of **GL_TRUE** indicates success, and **GL_FALSE** indicates failure.

Easy CHM v3.93

Create your first CHM help or CHM ebook files in 10 seconds with Easy CHM.

Key features of Easy CHM :

- Make CHM (Html Help) file by import folders and all sub folders.
- Automatically generate TOC and Index Item by parsing from title/filename/text of a specific line.
- Easy to use TOC (Table of Contents) editor support 'Search and replace in TOC items'.
- Easy CHM can convert any chm files to html freely.
- Easy CHM can convert htm/html/mht/picture and other files to CHM.
- Plenty of customized options in EasyCHM.
- Multilanguage support.
- Built-in chm files decompiler in EasyCHM.
- You can save the project for future editing.
- Automatically output Alias and Map files for you.

Download free trial | Order now | More info...

Zipghost v3.73

Zipghost is a powerful time-saving and easy-to-use 'Batch compression' and 'Batch decompression' utility.

Key features of Zipghost :

- Convert any selected files or folders to one zip.
- Convert each folder to one zip in batch processing.
- Convert each file to one zip in batch processing.
- Extract any selected archive files with just one-click.
- Extract all zip files in a folder and its subfolders with batch processing.

Download free trial | Order now | More info...

Chm Decompiler v3.65

ChmDecompiler is a batch decompiler for Compiled Windows HTML Help files (*.chm). ChmDecompiler can extract all/any source files in a MS .chm file or ebook easily and quickly, even the .HHP project file can be recreated perfectly! ChmDecompiler is also an easy-to-use .chm file viewer.

Chm decompiler is very useful if you want convert any CHM to Html in batch processing.

Key features of ChmDecompiler :

- Decompile a MS chm help file or .chm ebook quickly and easily.
- Recreate the .HHP project file.
- Decompile all MS CHM files / CHM ebooks in batches.
- Extract any files from a chm file or chm ebook.
- Convert any chm files to html freely.

Manage chm file like a zip file.

- An excellent chm viewer or chm reader - you can analyze the internal structure of a CHM.
- Integration with Windows shell.
- Multilanguage support.
- Built-in chm files decompiler.
